1. **FLUSH MOUNTING MAGNET ASSEMBLY**
   Open door and mark position of door holder. Install standard electrical flush mounting box (supplied by installer). Connect wires to magnet terminals and fix magnet assembly to flush mounting box. With door open, align keeper plate and magnet face within ± 1mm. Fix keeper plate to door using screws supplied.

2. **MOUNTING MAGNET ASSEMBLY WITH SURFACE MOUNTING BLOCK**
   Open door and mark position of door holder. Fix standard electrical mounting block (supplied by installer) to wall. Connect wires to magnet terminals and fix magnet assembly to mounting block. With door open, align keeper plate and magnet face within ± 1mm. Fix keeper plate to door using screws supplied.

3. The nominal working voltage for door holder FP0100 is 12Vdc ± 20% at 0.1 amps. The nominal working voltage for door holder FP0101 is 24Vdc ± 20% at 0.05 amps.

4. For maximum pull, the door holder should be mounted as shown below with magnet and keeper plate parallel. Length "A" must be at least 3 times length "B" for the door holder to provide adequate pull.

5. Plastic mounting hole caps are supplied with each door holder, 2 loose in packaging and 2 are press fitted to the back of the door holder plastic cover plate.
