Information contained in this document is believed to be accurate and reliable, however Tyco Fire Protection Products reserves the right to change the content without prior notice.
TYCO FIRE PROTECTION PRODUCTS
END USER LIABILITY DISCLAIMER

The VIGILANT F3200 Fire Indicator Panel and NDU have a configuration programming facility which may be accessed from the keypad by using a password.

This programming facility allows the user to define detail of the operation of the System is being customised. It is possible for the user to program operational features that prevent the unit from meeting statutory requirements.

Tyco Fire Protection Products does not accept responsibility for the suitability of the functions programmed by the user.

CISPR 22 NOTICE

This is a class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

CHAPTER 1
INTRODUCTION
1.1 SCOPE

This manual provides information for the personnel responsible for planning, ordering, installing and configuring a VIGILANT F3200 Fire Alarm System or an NDU. It is assumed that such staff have been trained to plan/install fire alarm equipment and are familiar with the relevant standards.

The manual is divided into the following chapters:

Chapter 1  Introduction: Information on this and other manuals.
Chapter 2  System Description: A description of the structure of the F3200 FIP.
Chapter 3  Specifications: A detailed specification and list of part numbers for the F3200.
Chapter 4  Configuring a FIP: Information on configuring a system, in particular battery and charger calculations.
Chapter 5  Installation & Wiring: Detail of installation and field wiring.
Chapter 6  Applications: Detail of configuration and wiring for specific applications.
Chapter 7  Alignment, Adjustment & Placing Into Operation: Detail on how to adjust an F3200 in the field and place it into operation.

Appendix A  1. Compatible Detectors: A list of detectors which are approved for use with F3200.

2. Detector Configuration: Detail on AZC and zone configuration for specific detector types.
1.2 ASSOCIATED DOCUMENTATION

1.2.1 PRODUCT

The following manuals for the AS4428.1-approved F3200 are available:

F3200 AS4428.1 Operator's Manual  For panels that comply with AS4428.1
LT0251 is in A4, loose leaf form.
LT0250 is in A5, bound form.

F3200 Technical Manual  Provides technical information for system
designers and service staff. Part number
LT0121.

F3200 AS4428.1 Installation &
Configuration Manual  This manual. Provides information for
personnel responsible for system design,
installation and commissioning. Part number
LT0255.

F3200 AS4428.1 Programming Manual  Provides information for programming an F3200
and NDU. Part number LT0256.

1.2.2 STANDARDS RELATED

This manual makes reference to the following Australian and combined Standards:

AS1603.4  Automatic Fire Detection and Alarm Systems (obsolete)
Part 1 - Control and Indicating Equipment.

AS4428.1  Automatic Fire Detection and Alarm Systems
Part 1 - Control and Indicating Equipment.

AS/NZ1668.1  The use of Ventilation and Air-conditioning in Buildings.
Part 1 - Fire and Smoke Control in Multi-compartment Buildings.

AS1670.1  Automatic Fire Detection and Alarm Systems-
System Design, Installation and Commissioning.

AS1851  Maintenance of Fire Protection Equipment
Automatic Fire Detection and Alarm Systems.

AS/NZS 60950.1  Information Technology Equipment – Safety

AS/NZS CISPR22 Information Technology Equipment – Radio Disturbance Characteristics

AS4214  Gaseous Fire Extinguishing Systems.

This manual makes reference to the following New Zealand standards:

1.4 GLOSSARY OF ABBREVIATIONS

The following abbreviations are used throughout this manual:

A/C : Air Conditioning
ac : Alternating Current
AEOL : Active End of Line
Ah : Ampere Hour
ANC 1 : Ancillary Relay 1
ASE : Alarm Signalling Equipment
AZC : Alarm Zone Circuit, or Detection Zone
AZF : Alarm Zone Facility, or Group (AS1603.4 terminology)
AVF : Alarm Verification Facility, or Check Alarm
Bd : Board
CIE : Control & Indicating Equipment
Char : Character
Cct : Circuit
COM : COMMON relay contact
dc : Direct current
EB : External Bell
EEPROM : Electrically Erasable Programmable Read Only Memory
ELV : Extra Low Voltage
EOL : End Of Line (device)
EOLR : End of Line Resistor
Expn : Expansion
E2 : Electrically Erasable Programmable Read Only Memory
FF : Fire Fighter Facility (part of Display/Keyboard)
FIP : Fire Indicator Panel
FRC : Flat Ribbon Cable
I/O : Input/Output
LCD : Liquid Crystal Display
LED : Light Emitting Diode
MAF : Master Alarm Facility
Max : Maximum
Min : Minimum
MCP : Manual Call Point (Break Glass Switch)
MOV : Metal Oxide Varistor (Used for electrical Surge Protection)
msec : Millisecond
NC : Normally Closed
NDU : Network Display Unit

1.5 GLOSSARY OF TERMINOLOGY

The following terminology is used throughout this manual:

- **Ancillary Equipment**: Equipment external to Fire Alarm system
- **Ancillary Relay**: Relay to switch external equipment
- **Auxiliary Output**: Output for driving additional LEDs/relays
- **Baud**: Bits per second
- **Control Output**: Output from FIP to other equipment
- **Default**: Pre-programming option or logic equation i.e. one that exists without the user configuring or programming it.
- **Detector**: Alarm Detection Device (electrical transducer)
- **In Situ Test**: Mode allowing one person to test detectors
- **Monitoring Service**: Fire Brigade Authority, or any other authority which receives the FIP alarm signals.
- **Mapping**: Programmable causal relationship between inputs and outputs
- **Zone**: Fire searchable area of building represented by a unique number and name in the FIP, and associated with the AZC of the same number.
CHAPTER 2
SYSTEM DESCRIPTION
2.1 OVERVIEW

2.1.1 GENERAL
The F3200 is a self-contained, modular, intelligent Fire Indicator Panel (FIP) which performs the functions of the Control and Indicating Equipment (CIE) as specified by the Australian Standard AS4428.1.

It has a high degree of flexibility and expandability, catering for medium to very large buildings from 8 zones or less, to 64 zones maximum. Refer to the constraints specified in Section 3.1.3. More panels and zones can be added through the use of the Panel-link Network and the appropriate networkable F3200s.

An NDU (Network Display Unit) is essentially a networked F3200 that doesn't have any alarm zone or relay modules, but displays information received from other FIPs on the network. A number of versions are available. Some in larger cabinets have their own MAF/PSU and battery, while other slim-line versions have just the Operator Display (and Controller) and require power from a FIP (or similarly monitored and battery backed source). An NDU may be programmed to operate in either Australian (default) or New Zealand Mode.

2.1.2 DETECTOR CIRCUITS
The F3200 detector interface electronics caters for a wide range of detectors, including various types which have high alarm current requirements. A full range of compatible detectors is listed in Appendix A. F3200 also caters for interfacing to:
- Intrinsically safe circuit barriers/isolators (hazardous areas);
- Long line circuits e.g. from a sub-indicator FIP;
- Tamper-proof circuits e.g. for water valve supervision.

2.1.3 DISPLAYS
The primary display of the F3200 is a 2 line by 40 character LCD on which the status messages and prompts are shown. The LCD has backlight illumination which is turned on when there is an alarm or operator interaction. Common conditions are displayed on 9 LEDs adjacent to the LCD.

The display panel composed of the LCD, common LEDs and keypad is called the Operator Display panel. The portion within the red border is called the Fire Fighter's Facility (FF). It includes the common status LEDs for ALARM, ISOLATED and FAULT. As an optional extra, individual zone status (ALARM, ISOLATE and FAULT) can be displayed on LEDs by fitting the appropriate number of 16 Zone LED Display boards. By default Zone 1 corresponds to the top row of LEDs (3) on the left most display, Zone 2 to the row below it, etc, (top to bottom, left to right). Display Bds may also annunciate Relay status. Alarm LED on = relay energised, Isolated LED on = relay isolated, Fault LED on = relay wiring fault (i.e. supervision fault). The relay LEDs simply follow the zone LEDs in the same order that they occur in the FIP. For example, a system with 3 x 8 Zone Modules, 2 x 8 Relay Modules, would require 3 Display Bds. Relay 1 will be annunciated on the 25th row of LEDs and the last 8 rows will be unused. Mapping zones and relays to LEDs in other patterns is programmable.

The F3200 electronics includes, as standard, an open collector transistor output for each zone which can be used to drive an internal or remote mimic display.

An NDU in New Zealand mode may have an additional 3 system status indicators on the NZ Display Extender board fitted. This provides the Fire, Defect, Normal LEDs, and also connects to a Termination Bd which accepts the NZ specific inputs and outputs including the Trail Evac and Silence Alarms key-switches.
FIG 2.1.1
F3200 STANDARD CABINET - FRONT VIEW
2.1.4 OUTPUTS

The F3200 MAF/PSU Module provides 7 relays as standard. These are used for signalling to the Brigade (Monitoring Service) and for switching the External Bell, Warning System and ancillary equipment such as door holders, air-conditioning shutdown, etc.

When more than 7 relays are required, additional sets of 8 can be added by fitting 8 Relay Modules.

All outputs, including the open collectors on the 8 Zone Modules, are individually programmable by a logic equation of zone and FIP status. The default configuration (link setting and programming) dedicates 4 of the 7 relays (Alarm, Isolated, Fault and Standby, commonly called the MAF relays) to interface to the ASE (Alarm Signalling Equipment), 1 (labelled Anc2) to drive the External Bell (EB), and 1 (labelled Anc3/Bells) to drive the Warning System (WS). The MAF Standby relay has electronics which forces it to de-energise at the Battery Very Low voltage, and this must be considered if using if for any function other than its default one.

2.1.5 POWER SUPPLY

The F3200 has a 3 Amp battery charger/power supply as standard. There is adequate room for large batteries. Versions are available that have a 6 Amp PSU.

2.1.6 REMOTE DISPLAYS & PRINTER

A serial port (RZDU protocol) is included in the F3200 and NDU that provides a 3 or 4 wire link to up to 8 Remote Display Units (RDU). Several versions of RDU are available.

The most commonly used versions have small, slimline cabinets (flush and surface mounting) not much larger than the F3200 display-keyboard which is fitted on them. They receive power from the F3200 FIP or NDU. Other versions look like an F3200 FIP, have their own power supply, and may have LED Display Boards fitted to them.

Additional mimic-only devices can be connected to the RDU output to monitor the F3200 zone status. For example, IO-NET can be used to provide floor mimic panels, AS1668 interfaces or remote outputs for evacuation panels.

For a networked system, an RDU can display (and control) only the zones and relays of the FIP to which the RDU is connected. With appropriate programming, such an RDU could be used to isolate the Warning System of that FIP, and hence isolate the Warning System across the entire network.

2.1.7 LOGGING PRINTER

A serial printer may be connected to the F3200 or NDU to provide a log of events and operator actions, and also to print the programmed database.

Events which are printed include:

(i) Zone Events, e.g. Alarm, Fault;
(ii) Zone Commands, e.g. Reset, Isolate;
(iii) System events, e.g. communication failures, battery faults, etc.

The printout includes the time and date, the cause of the event (e.g. Zone, Relay, RDU or FIP), and the event type. Events and commands for zones and relays that have a text name programmed also have the name printed. F3200 is able to store at least 100 events for printing, being the first 100 events to occur.

As events are printed, more events are able to be put into the list. If events cannot be put into the list because it is full, the FIP keeps a count of those events it has had to discard.
LOGGING PRINTER (CONTINUED)

When the FIP is next able to put more events into the list, it prints out the number of events it had to discard.

For a networked system, with appropriate programming, an F3200 panel (or NDU) may print events and accumulate history for some or all of the other panels on the network.

2.1.8 NETWORKING CAPABILITIES

A number of F3200 fire panels, NDUs and other Panel-link compatible devices may be connected together to form a large distributed system. With suitable programming events may be annunciated at, and controlled from, other panels on the network. A panel (or NDU) may be set up as a main panel to provide a common monitoring service connection point with display and control of all facilities on the network.

The F3200 can be networked in a variety of ways:

- Dual channel RS485 links using the FP0795 kit.
- Ring RS485 using the FP0771 I-HUB.
- IP over fibre-optic cable using the FP0986 PIB and Moxa Ethernet switches, or over copper wire pairs by adding 2 x Westermo Ethernet Extenders per cable pair.

The F3200 system supports the addition of colour graphics display and control terminals on the network. These units can be programmed to show graphical displays on zone alarm or fault conditions. The operator can use function keys or an optional touch screen to generate commands to the F3200 and thus have remote control of it.

2.1.9 GASEOUS FIRE EXTINGUISHING PANELS

A range of F3200 panels are available specially assembled and programmed for gaseous fire extinguishing applications complying with AS4214.
2.2 PHYSICAL STRUCTURE

The F3200 has a rugged, lockable painted steel cabinet, which houses 19 inch rack-mount equipment and comes in two height options (both have the same width and depth). The standard cabinet accommodates 15U total and the small cabinet accommodates 8U (where 1U = 1 3/4" = 44.5mm).

The Operator Display has a screened, polyester overlay mounted on a hinged inner door fitted to the top 4U position. The Controller/Display pcb mounts directly to the rear of this door.

**Standard Cabinet**

In the standard cabinet the space below the 4U Operator Display panel is covered by a blanking plate, but there is provision for mounting other equipment (e.g. a 7U hinged inner door for a mimic, or 16 Zone LED Display Bds), in place of this blanking plate.

There is provision for mounting additional equipment in the bottom 4U (e.g. an ASE rack), but this might encroach on battery space.

The outer door has a large acrylic window to allow viewing of the equipment inside.

Four versions of FIP are available in this cabinet. The FP0781 and FP0783, which cater for up to 64 zones, have a Cardframe fitted to the rear wall as shown in Fig 2.2.1. The FP0780 and FP0782 have provision (PCB stand-offs) for mounting up to three 8 way modules (i.e. 3 x 8 Zone or 8 Relay Modules) on the rear wall. All of these panels are supplied with one 8 Zone Module fitted.

**Small Cabinet**

In the small cabinet, only 1U (of the 4U) below the 4U Operator Display is visible through the outer window. The gap is covered by a blanking plate (2U), which can be replaced by a bracket for mounting a limited range of equipment, e.g., a 1U ASE bracket, or a 1U 1 Zone Gas Control Panel.

A 6A PSU or a 7U LED Display door cannot be fitted, but the 4U 80 zone door (ME0457) can be (note reduces battery space).

Up to four 8 way modules can be mounted on the rear wall, but the bottom two of these share space with the batteries. Mounting arrangement and maximum capacity are shown in Fig 2.2.2.

Only one FIP is available (FP0784), and this comes with one 8 Zone Module fitted (in the top left position).
FP0781 and FP0783 have the Cardframe as shown.
FP0780 and FP0782 have the modules on the rear wall (3 max).

FIG 2.2.2
F3200 SMALL CABINET, MAXIMUM CONFIGURATION
2.3 SYSTEM STRUCTURE

2.3.1 PCB MODULES

The printed circuit boards which may be used in an F3200 include:

**Controller/Display**
Mounts on 4U inner door.
Includes: LCD, status LEDs, buzzer, and keypad connection
5Vdc supply voltage monitors for battery charger
microprocessor & memory
serial I/O bus control for all other modules
reference voltage generation for I/O modules
UARTs and serial port electronics
real time clock calendar integrated circuit
FRC connection to other modules.

**MAF/PSU**
Mounts on cabinet rear wall.
Includes: battery charger/PSU
22V regulator for detector circuits
Brigade & Ancillary relays and supervision circuitry
MCP & door switch inputs
screw terminals (most demountable) for field wiring
FRC connection to other modules.

**8 Zone Module**
Mounts on cabinet rear or in Cardframe.
Includes: electronics to I/F to 8 Alarm Zone Circuits (AZCs)
8 open collector auxiliary outputs
demountable screw terminals for field wiring
FRC connection to other modules.

**8 Relay Module**
Mounts on cabinet rear or in Cardframe.
Includes: 8 relays and supervision circuitry; demountable screw terminals for field wiring; FRC connection to other modules.

**16 Zone LED Display (FP0475)**
Mounts on 7U inner door (ME0060).
Includes: 16 sets of 3 LEDs; electronics to control the LEDs (serial bus).

**16 Zone LED Display (FP1002)**
Mounts on 4U door (ME0457).
Includes: 16 sets of 2 LEDs, red = alarm, amber = fault (flashing), isolated (steady).

**RS485 Communications Bd**
Mounts on right hand side of cabinet.
Includes: Connecting FRC and mounting parts.

**I-HUB Communications Bd**
Mounts on right hand side of cabinet.
Includes: Connecting FRC and mounting parts.

**PIB Panel-Link to IP Bridge Communications Bd**
Typically mounts on bracket on right hand side of cabinet.
Includes: Mounting hardware and panel connection cables.
FIG 2.3.1
SYSTEM STRUCTURE
2.3.2 INTER-CONNECTION & STRUCTURE

A basic F3200 system has one Controller/Display, one MAF/PSU, and one 8 Zone Module, all connected by Flat Ribbon Cable (FRC) on a common Input/Output (I/O) Bus.

Additional 8 Zone Modules and/or 8 Relay Modules can be fitted to the I/O bus, with a maximum of eight 8 way modules. This is shown in the block diagram of Fig 2.3.1.

The physical maximums are:
- three 8 way modules in an FP0780 or FP0782.
- four 8 way modules in an FP0784 (with restrictions)
- eight 8 way modules in an FP0781 or FP0783.

Expansion is from top to bottom.

The I/O Bus Out of one module connects to the I/O Bus In of the next module via the 20 way FRC provided (LM0053). No link or "End of Bus" is required on the last module.

To further extend these capabilities, up to 64 F3200s may be networked together, with full sharing of information and remote control of each panel by a master panel.

16 Zone LED Display Bds are driven from a separate serial bus on the Controller/Display. They receive power from the MAF/PSU via two power leads. Where more than one is required they are connected in series (up to 4 maximum) from right to left (as viewed from the front) on the FIP. The 26 way FRC from J13 of the Controller goes to J1 ("From Previous") of the right hand Display Bd. Zone 1 (default) corresponds to the top LEDs on the left hand Display Bd. The last board requires the "end of bus" Minijump connector to be fitted. Note that a special FRC cable is required to connect the Controller Board to the first Display Board (LM0092).

Where LED Display Bds are fitted, the default programming requires one Display Bd (16 zones) for every two 8 Zone or 8 Relay Modules, i.e. one for 1-16 zones, two for 17-32 zones, etc.

Zone 1 corresponds to the top row of LEDs on the left most Display; Zone 2 to the row below it, etc., (top to bottom, left to right).

LED Display Bds may also annunciate relay status, i.e. Alarm = relay energised, Isolated = relay isolated, Fault = relay wiring fault (i.e. supervision fault). The relay LEDs simply follow the zone LEDs in the same order that they occur in the modules. E.g. a system with three 8 Zone Modules and two 8 Relay Modules would require 3 Display Bds. Relay 1 would be annunciated on the 25th row of LEDs and the last 8 rows would be unused.

Mapping zones and relays to LEDs in other patterns is programmable.
CHAPTER 3
SYSTEM SPECIFICATIONS
### 3.1 GENERAL

#### 3.1.1 FIP PART NUMBERS & DESCRIPTION

(Refer also to 3.8 following).

- **FP0780** F3200 AS4428 FIP, NO CARDFRAME, 24 ZONE MAX, 1931-95
  - Includes: Full size cabinet
  - Controller/Display with Operator Display & Keypad
  - MAF/PSU (includes 7 relays, 3A/6A Battery Charger)
  - 1 x 8 Zone Module with standard EOLRs
  - Modules fit to cabinet rear wall (up to 3 modules max)

- **FP0781** F3200 AS4428 FIP, C/W CARDFRAME, 64 ZONE MAX, 1931-95
  - Includes: Full size cabinet
  - Controller/Display with Operator Display & Keypad
  - MAF/PSU (includes 7 relays, 3A/6A Battery Charger)
  - Cardframe (can house up to 8 modules)
  - 1 x 8 Zone Module fitted in Cardframe
  - includes standard EOLRs

- **FP0784** F3200 AS4428 FIP, SMALL CABINET, 1931-71, 8 ZONE
  - Includes: Small size cabinet
  - Controller/Display with Operator Display & Keypad
  - MAF/PSU (includes 7 relays, 3A Battery Charger)
  - 1 x 8 Zone Module with standard EOLRs
  - Modules fit to cabinet rear wall (up to 4 modules max)

- **FP0876** F3200 AS4428, 8U CAB, 3A, 1U GAS CTL, PRE-PROG
  - Includes: FP0784 with 1 x 8 Relay Module and ME0442 fitted, wired and programmed as a gas release panel.

- **FP0877** F3200 AS4428, STD CAB, 6A, 1U GAS CTL, PRE-PROG
  - Includes: FP0782 with 1 x 8 Relay Module and ME0442 fitted, wired and programmed as a gas release panel.

#### 3.1.2 SYSTEM EXPANSION

Expansion to the base panels is by adding 8 way Zone or Relay Modules, or by networking multiple panels together.

- **FP0553** F3200 8 ZONE INPUT EXPANSION KIT
  - Includes: 8 Zone Module, FRC, 8 x EOLR (std).

- **FP0554** F3200 8 RELAY EXPANSION KIT
  - Includes: 8 Relay Module, FRC, 8 x Minijump links (for supervision selection).

#### 3.1.3 ENVIRONMENTAL

- Operating Temperature : -5°C to 45°C (Ambient)
- Relative Humidity : 95% maximum @ 40°C (non-condensing)
3.2 MECHANICAL SPECIFICATIONS

CABINETS

Style : Wall mounting
Hinged outer door with large window (hinges to left)
Accepts 19” rack mounting equipment
4U Display on hinged inner door (hinges to right)

Construction : Welded steel

Material : 1.2mm and 1.6mm mild steel

Size :
- Standard : 750mm (H) x 550mm (W) x 210mm (D) * (Iss B cabinet)
- Small : 410mm (H) x 550mm (W) x 210mm (D) *

* MCP is an additional 20mm.

Finish : Powdercoat BFF-998-CW
Cream Wrinkle
(Iron Phosphate pre-treat)

Weight :

Notes:
1. All voltages stated in VDC at temperature of 20°C.
2. Apply temperature compensation of -36 mV/°C for temperature deviation from 20°C.
3. This applies also to charger voltage 27.3 VDC.
4. There are thermal delays, therefore if checking or adjusting in field ensure unit has been running for some hours.
5. Standby Relay is normally energised (on), and turns off for Battery fail.

</tbody>
</table>

**Notes**

1. The base panel includes Controller/Display, MAF/PSU and 1 x 8ZM with all ACZs enabled and with EOLRs (2K7 for mode 1 or 2).
2. Quiescent current for an enabled AZC is for modes 1 or 2 (standard or high current) and includes the 2k7 EOL, but not the detector current (up to 4mA detector current per AZC).
3. Quiescent current is only 2.5mA per AZC for mode 3 and 1mA for mode 4.
4. Alarm current is for AZC mode 1, refer AZC specifications for other modes.
5. The 8 Zone Modules (8ZMs) are supplied from the fused battery supply via the 22V regulator which has a maximum rating. The 8 Relay Modules (8RMs) are supplied directly from the fused battery supply.
6. Quiescent and alarm currents do not include external loads e.g. door holders, bell, sounders etc.

Notes

3. I.e. short at end of an 800 Ohm circuit (gives voltage band B2 alarm, ref. graph 3.4.1).

4. I.e. short at end of a 2000 ohm circuit (gives voltage band B3 alarm, ref. graph 3.4.1).

MCP Zener Diode

For voltage band B3 operation  BZT03C15 3W, 15V.

Detector Alarm Currents

The current available to a latched detector is the AZC supply current at the detector "Alarm" voltage minus the EOLR current and the remaining quiescent current at that voltage.

The following graphs show current/voltage characteristics for the various modes of operation.
Notes:

1. The graphs are typical values shown for PCB Iss E3 and later.
2. For Issue D2 and earlier subtract 1mA from each (1.5mA at low voltage).
3. The current available to the detector is Icl (current limit) – I EOLR (2k7 End Of Line).

GRAPH 3.4.1
AZC CURRENT LIMIT (MODES 1 & 2)
Notes:

1. The graphs are typical values shown for PCB Issue E3 and later.
2. For Issue D2 and earlier subtract 1mA from each (1.5mA at low voltage
3. The currents are applicable only after Alarm has been latched.
4. Current available to the detector prior to Alarm being latched is as per Mode 1.
5. The current available is Itot (current limit plus pull-up resistor) – I EOLR (2k7 End Of Line).

GRAPH 3.4.2
AZC CURRENT AVAILABLE IN MODE 2
A short circuit at the end of an 800 Ohm line will give a B2 (Detector Operated) alarm.

A short circuit at the end of a 2k Ohm line will give a B3 (programmable) condition.

GRAPH 3.4.3
AZC CURRENT VS VOLTAGE MODES 3 & 4 (LOW CURRENT & TAMPER)
AZC SPECIFICATIONS (CONTINUED)

**Timing**

Standard Delay (into Alarm, Fault, Normal) 2.3 sec (2.0 - 2.6 sec)

AZC Reset 5.3 sec (5.0 - 5.6 sec)

AZC Ignore Period 1 (after Reset) 2 sec nom (plus std 2.3 sec delay)

AZC Ignore Period 2 (after Start Up or Programming) 1 sec nom (plus std 2.3 sec delay)

AZC Time Into Alarm Programmable 0-250 sec

AZC Time Out of Alarm Programmable 0-250 sec

**3.4.2 MAF/PSU INPUTS**

Battery Termination One pair screw terminals; 4sq mm max cable

AC Input 31V rms; 3.6A rms; 2.8mm tab terminals

Door Switch 5V, 0.5mA, Unsupervised, 4 Way .1" pcb header, J6

MCP 5V, 1mA, 2k7 EOLR, 4 Way .1" pcb header, J6

Spare Inputs (not fitted) 5V, 0.5mA, Unsupervised, Cabinet internal use only, 4 Way .1" pcb header, J5

**Relay Supervision**

Anc 1 Sup/Anc 2 Sup One screw terminal each

Modes of Operation 1 Door holder
                     2 Load

<table>

**Default Modes**

Anc 1 Door Holder, Disabled
Anc 2 Load, Disabled

Voltage Threshold (Door Holder Mode) 3.65V Nom

Supervision Current 0mA @ +5V, 1mA @ 0V
MAF/PSU INPUTS (CONTINUED)

Load Resistance (Load Mode) 400 Ohm - 10k Ohm
less than 400 Ohm with series diode at load.
14 Ohm absolute minimum.

Anc 3 Supervision

Input Termination Output terminals BELLs +, -
Form Reverse polarity - requires series diode at each device
Resistor EOL

End of Line No. of
Circuits Type
1 3k3, 5%, 250mW resistor
2 6k8, 5%, 250mW resistor
3 10k, 5%, 250mW resistor

Supervision Current 0mA @ +5V, 1.5mA @ 0V, +ve to BELLs- terminal
Circuit Resistance 100 Ohm max.

3.4.3 CONTROLLER/DISPLAY INPUTS

Spare DC Input/Output 24Vdc nom
Demountable screw terminal, 4 way, J5
Spare Input 22V, 10k Ohm pull up resistor
Provision for supervision (up to 5 band)
Spare Inputs IP0, 1, 2 (not fitted) Unsupervised
Cabinet internal use only
+5V, 100k pull up resistor
10 Way FRC header, J10
Serial I/O RZDU Refer Section 3.5.3; Others 3.5.2

3.4.4 8 RELAY MODULE SUPERVISION

Form Load monitoring

Relay Off
Resistance to 0V
Relay On Voltage Present

Selected By Minijump link on PCB & programming of FIP
Default Programming Supervised
Load Resistance 400 Ohm - 10k Ohm
Less than 400 Ohm with series diode at load
14 Ohm absolute minimum

Voltage Threshold 3.65V nom.
Supervision Current 0mA @ +5V, 1mA @ 0V
3.4.5 NZ MODE DISPLAY EXTENDER BOARD INPUTS

The Display Extender Board is used with New Zealand operation only. The inputs it provides are: Silence Alarms, Trial Evac, Building Services Restore, Lamp Test and External Defect. All inputs have closure to zero volts to assert the input. An input may be left open or unconnected if not used. Refer to section 5.11 for wiring.

All Inputs

Closure below 1.5V @ 0.35mA required to activate.
Open voltage = 5V

MAF/PSU OUTPUTS (CONTINUED)

Ancillary & Bells

**Anc 1, Anc 2**
1 Pole voltage-free changeover contacts
Termination Demountable screw terminals, 1.5sq mm max cable
Rating 30V, 1Adc inductive, 30V, 2Adc resistive

(Note: The relays are 2 pole, with second pole terminated on PCB pads).

Operation Programmable (refer Programming Manual)
Default (Anc 2 is External Bell)
Supervision Separate terminal (ref 3.4.2)

**Anc 3/Bells**
2 pole relay
Link selectable function
Standard Format Polarity reversal, switched 24Vdc output
2 terminals, Bells +, -
Demountable screw terminals, 1.5sq mm max cable
Option 1 Pole voltage-free changeover contacts
Snip Links Lk2, 3, 4.
Rating 30V, 2Adc resistive, 30V, 1Adc inductive
Operation Programmable (refer Programming Manual)
Default Warning System
Supervision On Bells +, - terminals only (ref Section 3.4.2)

Power Supply Outputs

0Vdc
Termination 1 non-demountable screw terminal, 4sq mm max cable
2 demountable screw terminals, 1.5sq mm max cable
1 2.8mm tab terminal (LED Display)

Battery Backed DC Supply

Rating 27.3Vdc (24V battery nom).
+VBF1 (fused @ 2A) 1 non-demountable screw terminal, 4sq mm max cable
1 demountable screw terminal, 1.5sq mm max cable
+VBF2 (fused @ 6A) 1 non-demountable screw terminal, 4sq mm max cable
1 demountable screw terminal, 1.5sq mm max cable
1 2.8mm tab terminal (LED Display)

Non-Battery Backed DC Supply

Rating 28Vdc nom, 2Adc, fused
MAF/PSU OUTPUTS (CONTINUED)

+VNBF
1 non-demountable screw terminal, 4sq mm max cable
1 demountable screw terminal, 1.5sq mm max cable

RZDU Comms

Tx, Rx, 0V 3 Wire (+VBF2 available for 4th wire)
Transmission Rate 1200 Baud
Protocol Vigilant F4000
Termination Demountable screw terminals, 1.5sq mm max cable

3.5.4 CONTROLLER/DISPLAY OUTPUTS

Spare Parallel Outputs (not fitted)
Number, Rating 6, CMOS 0-5V
Termination 10 Way FRC PCB header, J10

Serial I/O

Printer/Programmer Port (This is same port as Serial Port 0)
Form Pseudo RS232, Rx, Tx, 0V signals only
Transient Protection Allows external wiring
Transmission Rate 9600 Baud
Protocol ASCII Xon, Xoff
Termination 4 Way .156" male Molex (J1), 9 Way Miniature D available via LM0041. Female Pins (socket)

Pin 2 3 5 1 4 6 7 8
Tx Rx 0V

25 Way Miniature D available via LM0042 Female Pins (socket)

Pin 2 3 7 6 8 20
Rx Tx 0V

Also available as 9 way male D connector (J27)

Serial Port 0
10 Way FRC header, J2
UART signals: RXD, TXD, RTS-, CTS-, DCD- 5V levels; 0V, +5V, +24V also available

Network 1 10 Way FRC header, J7
Network 2 10 Way FRC header, J9
UART signals for Network 1/2 RXD, TXD, RTS-, CTS-, DCD- 5V levels; 0V, +5V, +24V also available
3.5.5 NZ DISPLAY EXTENDER BOARD OUTPUTS

This is used in New Zealand mode only. Refer to section 5.11 for wiring of the outputs on the unprotected termination board. The Display Extender Board already has common Normal, Defect and Fire status LEDs fitted to it, but these may be replicated externally if necessary. There are also ancillary defect and fire outputs which are active low open collector, and an output to drive an index lamp.

All Outputs (except LAMP)  
Open collector pulldown to 0V  
Off voltage = 30V max  
On voltage = 1.1V @ 100mA (max)  
On Current = 100mA max

LAMP +  
Open collector pull up to VBATT  
Off voltage = 0V  
On voltage = VBATT - 1V  
On current = 400mA max

LAMP -  
Connected to Battery –
### 3.6 CONTROLS

#### KEYPAD

<table>
<thead>
<tr>
<th>Type</th>
<th>Polyester Membrane</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keypress</td>
<td>Buzzer gives short &quot;beep&quot; for valid keypress</td>
</tr>
<tr>
<td>FF Keys</td>

</tr>
<tr>
<td>4x4 Keypad</td>
<td>Digits 0-9; Clear/Esc; Enter; 4 x Logic Keys</td>
</tr>
</tbody>
</table>

**Zone Functions**
- Alarm, Fault and In-Situ Test; Isolate, Reset, Recall

**Ancillary Functions**
- Test, Isolate, Reset, Recall

**Relay Functions**
- Test, Isolate, Reset, Recall

**System Functions**
- Battery Test, Buzzer Test, Display Test, System Test
- Bell Test, External Bell Isolate, Warning System Isolate
- Recall: Alarms, Faults, Isolates, System Faults, History
- Set time and date
- Program and view parameters
- Print and save database

**Brigade Functions**
- Acknowledge Alarms
- View alarms (Next & Prev)
- Reset acknowledged zone in alarm
- Isolate acknowledged zone in alarm
- Brigade Test (via menu)

#### BUZZER (INTERNAL SOUNDER)

<table>
<thead>
<tr>
<th>Tone Steady</th>
<th>Fault, System Fault</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Unisolated zone (note 1) or relay supervision fault (note 2)</td>
</tr>
<tr>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Pulsing 2Hz</th>
<th>Unisolated zone alarm (note 1)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Slow Pulse</th>
<th>Door closed with Database Write Enabled (Lk7) or in Program Mode</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Cadence</th>
<th>Zone or In-Situ Test failed (note 3)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Short Pulse</th>
<th>Valid keypress</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Long Pulse</th>
<th>Invalid keypress</th>
</tr>
</thead>
</table>

**Notes:**
1) For zones not mapped to MAF (status only) the buzzer does not turn on (dependent also on programming of FF).
2) For relay supervision not mapped to MAF the buzzer does not turn on.
3) Cadence is repeated fast pulses with a pause.

#### NDU NZ MODE KEYSWITCHES

**Brigade Functions**
- Trial Evacuation, Silence Alarms, Services Restore
3.7      DISPLAYS

Standard Display

Includes : LCD; FF LEDs; System Status LEDs
Panel Size : 19”, 4U
LCD Size : 2 Lines of 40 characters, 5.5mm (H) x 3.2mm (W) per character
Site Name : 40 Characters max.
Zone Name : 30 Characters max.
Relay Name : 30 Characters max.
FF LEDs : ALARM (red); ISOLATED (yellow); FAULT (yellow); EXTERNAL
          BELL ISOLATE (yellow); WARNING SYSTEM ISOLATE (yellow)
System Status LEDs : MAINS ON (green); CHGR/BATT FAULT (yellow); SYSTEM FAULT
                     (yellow); AIF ATTENDED (yellow)
Internal Status LEDs : Mains On (green), Fuse Blown (yellow) on MAF/PSU PCB.

Optional Additional LED Display, 16 Zone (3 LEDs/Zone)

Requires 1 x ME0060 plus 1 x FZ3031 plus 1-3 x FP0475 as required.

ME0060   MECH ASSY, 1901-79, F4000 RAC, EXT INNER DOOR
          (19”, 7U, mounts up to 4 of 16 LED Display Bd)
FZ3031    KIT, F3200, 16 ZONE LED DISPLAY, LHS POSITION
FP0475    FP, F4000 DISPLAY EXTENDER KIT, 1901-26

Includes : 1 x 16 LED Display Bd (16 zone parallel LED display); FRC; Power leads; zone name label.
Format : 7U Parallel LED display mounts directly below the standard 4U LCD.
Zone LEDs : ALARM (red); FAULT (yellow); ISOLATED (yellow)
Name Space : 10mm x 60mm per zone on paper label.
             E.g. 2 lines of 23 characters at 10 per inch.

Optional Additional LED Display, 16 Zone (2 LEDs/Zone)

Requires 1 x ME0457 plus 1-5 x FP1002 as required.

ME0457    MECH ASSY 1982-40 MX1 4U 5 X 16 ZONE DISPLAY DOOR
          (4U module mounts 5 x FP1002 to give 80 zones of LEDs).
Format : 2 LEDs per zone, Red = ALARM, Amber = FAULT (flashing); Isolate (steady).
Name Space : 9 x 44mm per zone on paper label (LT0369).

New Zealand Mode Display Extender Board (applicable to NDU only)

Status LEDs: NORMAL (green), DEFECT (yellow), FIRE (Red)
PA0499    PCB ASSY,1901-119-1,F4000 NZ DISPLAY EXTENDER
3.8 ORDERING INFORMATION

The following lists the part numbers for the range of products and spares associated with an AS4428 F3200. It includes a brief description where considered necessary.

NEW ZEALAND OPERATION ONLY

A variety of display options for the NDU are available to satisfy varying NZ requirements. These are covered in detail in Section 5.12. Ordering codes are included for the various components for each option. Major items are as follows:

PA0499  PCB ASSY, NZ DISPLAY EXTENDER BOARD
NZ Display Extender Board in standard 16 Zone LED board format.

PA0741  PCB ASSY, PFD 16 ALARM LED DISPLAY, 24V
“Picture Frame” format 16 Zone display board (alarm LEDs only).

PA0753  PCB ASSY, PICTURE FRAME DISPLAY, 16 LED MIMIC, 24V
“Picture Frame” cabinet format board for mimicking 16 Fire LEDs from Display board.

PA0483  PCB, UNPROTECTED TERMINATION BOARD
With a 26 way FRC gives access Display Extender Board inputs and outputs.

PA0769  PCB, UNPROTECTED TERMINATION BOARD, C/W RESISTORS
Version of PA0483 with 3k3 resistor per output for LED current limit.
CHAPTER 4
CONFIGURING A FIP
4.1 GENERAL

An F3200 FIP is configured to suit a particular customer's requirements by:

- Fitting and connecting the required PCB modules;
- adjusting or removing links on the PCBs; and
- programming the FIP.

The detectors, manual call points (MCPs), warning devices, ancillary equipment and field wiring that are connected to the FIP must match the FIP configuration.

The FIP configuration data, which is entered during programming, is stored in the non-volatile memory database. The database may be saved to a computer for backup storage, and reloaded from the computer.

All programmable options have a default option for the most likely usage. That is, for many applications, no programming other than entry of site and zone names will be necessary.

Programming is described in detail in the F3200 AS4428.1 Programming Manual LT0256.

4.2 MODULE CONFIGURATION

The required modules are fitted to the F3200 as described in Section 2.3.2. Note that 8 way modules are connected Bus Out to Bus In, with all 8 Zone Modules preceding any 8 Relay Modules. Where it is desired to add a module to an existing system this can be done by programming the Module Configuration through the keyboard (Refer to LT0256 Programming Manual).

The F3200 does various self-tests on start-up and includes checking to see what modules are present (including 16 Zone LED Display Bds). It displays the results on the LCD. If the modules present do not agree with the programmed database then the FIP annunciates this and remains inactive.

E2 Initialisation causes the Controller/Display to accept the modules found as present and stores this configuration in the database. E2 Initialisation also clears all other data programmed in the database.

For servicing, modules can be temporarily removed as detailed in Section 10.2 of the Operator's Manual. This temporary configuration is not stored in the database.
4.3 BATTERY & POWER SUPPLY

4.3.1 GENERAL

The F3200 FIP has a dc power supply, which also serves as battery charger and requires a 24V sealed lead acid battery (i.e. 2 x 12V batteries in series) to be fitted. (See Section 3.3.3 for compatible batteries). Battery leads with 4.8mm Quick Connect receptacles (for connecting to the battery tabs) are included.

**Charger Rating** (Refer to AS1670.1 Section 3.16).

The standard F3200 has a 3A power supply. Versions are also available with a 6A PSU. This has a second mains transformer, a 3A rectifier PCB and a larger heatsink connected to the MAF/PSU. Several components on the PCB are also upgraded.

When a 6A power supply is fitted, the standard PTCs on the MAF/PSU are shorted out and additional battery protection must be fitted (see Section 4.3.5).

To comply with AS1670.1 the power supply rating must be sufficient to charge the batteries while powering the panel with 2 zones in alarm. This includes all remaining quiescent loads, common alarm load, plus 2 (or 20%, whichever is greater) of all connected fire suppression systems in the active state (i.e. solenoids, warning signs, etc).

The definition of charging the batteries is supplying enough current to charge them within 24 hours to provide a capacity that will support 5 hours of FIP quiescent load (i.e. with mains off) followed by 0.5 hour of alarm load for two, worst case zones.

The recommended order of performing calculations is listed in Section 4.3.2.

**Battery Rating** (Refer to AS1670.1 Section 3.16).

The battery capacity must be sufficient to support 24 hours of quiescent load (i.e. with mains off), followed by 0.5 hour of alarm load for two worse case zones.

**Notes**

1. The quiescent load includes the FIP electronics (in normal state) plus any external normally energised loads that operate from the battery backed supply. Hence door holders are normally supplied from a non-battery backed supply.

2. Alarm load includes FIP electronics (in alarm state) plus any external loads such as common Warning System, air conditioning shutdown relays, etc, plus the 2 (or 20%) fire suppression zones.

3. The capacity of a battery depends on the rate (i.e. current) at which it is discharged. Most batteries are quoted at a 20 hour discharge, e.g., a 10Ah battery will supply 0.5A for 20 hours. At 3 times the current (i.e. 1.5A) the same battery will discharge in typically 5.6 hours, i.e. the capacity is only 8.5Ah. At 10 times the rate the capacity is approximately 75% of the 20 hour rate capacity (i.e. 7.5Ah). Hence for alarm loads it is safest to derate the capacity to 50%.
GENERAL (CONTINUED)

4. The approvals laboratory recommends using 90% de-rating of batteries used on F3200 because the battery fail voltage (Standby) is 22V instead of 21V (as used on some other FIPs). The local approval body may not require this, however, because although the F3200 will not generate new alarms below the battery fail voltage, it will maintain any alarms and outputs that occurred when the voltage was higher than the battery fail voltage. AS1670.1 does, however, recommend 80% de-rating of batteries for the effect of ageing, i.e. multiply the required battery capacity (at end of life) by 1.25 when calculating the required capacity for a new battery.

5. For maximum physical battery sizes refer to "Battery Size". (Refer to Section 4.3.4).

4.3.2 BATTERY/CHARGER CALCULATIONS

The recommended order of calculations is as follows:

1. Calculate the FIP quiescent load (Iq) from the figures given in Section 3.3.5. Note that the detector load for each AZC has to be added to the quiescent current per AZC. Calculate In separately, where In is the external non-alarm, non-battery backed load on the FIP PSU (e.g. door holders).

2. Calculate the FIP alarm load (Ia) for 2 zones in alarm from Section 3.3.5. (Include all external loads e.g. Warning System, relays).

3. Calculate the 5 hour/0.5 hour battery capacity for the charger requirement as follows:

\[
\text{Cap (5 hr)} = (5 \times \text{Iq}) + (0.5 \times \text{Ia} \times 2) \text{ Ah}
\]

\[
= 5\text{Iq} + 0.66\text{Ia}
\]

Iq = quiescent current

Ia = alarm current

Note that the 2 multiplier increases the required capacity to allow for an alarm load being discharged in 30 minutes.

4. Find the greater of Iq + In, or Ia. Calculate the power supply/charger requirement (Ic) as follows and check that it is less than 3A. (If greater, a 6A charger is required).

\[
\text{Ic} = \text{I} + \text{Cap (5 hr)} ÷ 24e
\]

where I is the greater of Iq + In, or Ia, and e is the charging efficiency of the particular battery being used, at the current being used (typically 80%, i.e. (cap/24) x 1.25).

5. Calculate the battery capacity as follows:

\[
\text{Cap (24 hr)} = (24 \times \text{Iq} + \text{Ia}) \times 1.25
\]

(See note 4 of Section 4.3.1 regarding the x 1.25 multiplier).

Select a battery which has a rated capacity (i.e. 20 hr rating) equal to or above that just calculated. (Refer to Sections 3.3.3 and 4.3.4 for approved types).

4.3.3 EXAMPLE BATTERY/CHARGER CALCULATIONS

An example FP0781 FIP has the following configuration:

- 3 8ZMs total (i.e. 2 x FP0553 expansion modules fitted)
- 1 8RM fitted
- 20 AZCs enabled, 4 disabled
- 42mA total detector current on the 20 AZCs
- 350mA of door holders off +VNBF
- 5 relays on the 8RM used, with supervision enabled, all switching 24V, 50mA relays, normally de-energised.
- Ancillary relay 1 (on the MAF) switching a 24V, 100mA load
EXAMPLE BATTERY/CHARGER CALCULATIONS (CONTINUED)

An external 24V bell drawing 30mA.
A PA0765 T-GEN 50 (Tones and Fault Monitoring) with a 16W speaker load.

Calculate the required battery capacity and check the power supply capacity.

Steps

1. The quiescent load (Iq) for the mains fail situation is:
   130mA (FIP including one 8ZM)
   + 82mA (second 8ZM, all AZCs enabled)
   + 4mA (third 8ZM, basic current only)
   + 4 x 10mA (third 8ZM, current for 4 AZCs)
   + 42mA (detector current)
   + 6mA (8RM, supervision enabled)
   + 42mA (PA0765 T-GEN 50 with Fault relay enabled)

   346mA

Say Iq = 0.35A for mains off.
The quiescent load for mains on is Iq plus the door holders (In = 0.35A) i.e. 0.70A. (It was purely coincidence that Iq = In).

2. Say, for example, that the 2 zones in alarm can, at most, turn on 3 of the 5 module relays plus the External Bell, the T-GEN 50 Warning System and the Anc 1 load.

   The alarm load for 2 zones in alarm is therefore:
   275mA (FIP including 1 8ZM, 2 zone alarm, MAF relays)
   + 82mA (second 8ZM, quiescent only)
   + 44mA (third 8ZM, quiescent only)
   + 42mA (detector current)
   + 6mA (basic 8RM current)
   + 3 x 11mA (3 relays on 8RM)
   + 3 x 50mA (loads on 3 relays)
   + 100mA (Ancillary 1 relay load)
   + 30mA (Bell load)
   + 704mA (T-GEN 50 alarm load of 16/50 x 2.2A).

   1466mA

Say Ia = 1.47A (the door holders are switched off in alarm).

3. Cap (5 hr) = 5 x 0.35 + 1.47 Ah = 3.22 Ah

4. Battery charger current required is:

   Ia (1.47A) is greater than Iq + In, (0.70A), therefore:

   Ic = 1.47A + (3.22/24) x 1.25 = 1.64A (where the 1.25 allows for charging efficiency e of 0.8) i.e. 3A is sufficient.

5. Battery capacity

   Cap (24 hr) = [(24 x 0.35) x 1.47] x 1.25 = 12.3Ah. (where the 1.25 allows for battery deterioration over lifetime to 80% of new value).

Two 12V, 17 Ah sealed batteries would be sufficient.
4.3.4 BATTERY SIZE

The maximum battery size given in the specification, Section 3.3.3, of 220mm x 220mm x 175mm, is imposed by the Cardframe, which obstructs insertion and removal of batteries in the bottom of the cabinet.

The maximum sizes which fit within this restriction are:

<table>
<thead>
<tr>
<th>Manufacturer</th>
<th>Model</th>
<th>Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Century Yuasa</td>
<td>PS-12400</td>
<td>40 Ah</td>
</tr>
<tr>
<td>IRH BB Battery</td>
<td>BP 40-12</td>
<td>40 Ah</td>
</tr>
<tr>
<td>Panasonic</td>
<td>LC-X1242P (AP)</td>
<td>42 Ah</td>
</tr>
<tr>
<td>YHZ Power</td>
<td>GP12400</td>
<td>40 Ah</td>
</tr>
<tr>
<td>Yuasa</td>
<td>NP38-12</td>
<td>38 Ah</td>
</tr>
</tbody>
</table>

If batteries larger than this are required, then a separate battery box (FP0576) can be used.

For an FP0780/782, or an FP0781/783 with a removable Cardframe, the maximum allowable size is 220H x 260W x 175D.

Fitting and removing batteries of this maximum size is difficult, and may require the removal of any modules or brackets fitted in the bottom of the cabinet.

These very large size batteries may also impede the plugging in and removal of modules fitted to the bottom position of the Cardframe.

Battery Combinations

Large capacity batteries can be made up of two parallel sets of 24V batteries of smaller capacities. This allows easier fitting, and allows larger capacities, and a greater range of capacity to be achieved than is possible with a single pair (as indicated above).

4.3.5 BATTERY OVERCURRENT PROTECTION

The MAF/PSU has two parallel PTCs, rated to carry over 3A, for battery overcurrent protection.

Where the Alarm load from the battery to the FIP is greater than 3A (i.e. with mains failed), or where a 6A power supply is used, an external, overcurrent device of suitable rating (greater than 6A), must be included, e.g., LM0571 20A Fused Battery Lead (see Fig 4.3.2). For this option the PTCs must be shorted by soldering a suitable copper wire between the two adjacent test points +VB and BATT+ (TP11 and TP16 on the MAF/PSU). For a FIP supplied with a 6A PSU, this is done in the factory and the LM0571 is included.
FIG 4.3.2
BATTERY OVERCURRENT PROTECTION FOR LOADS GREATER THAN 3A
POWERING AN F3200 FROM AN EXTERNAL DC SUPPLY

To comply with AS1670.1 F3200 uses a 240Vac supply as the primary power source and back-up batteries as the secondary power source. However the F3200 may be powered from an external dc supply. This must be battery backed, or have another form of secondary source to comply with AS1670.1. The supply must provide a voltage and current within F3200’s operating range (preferably 25-27Vdc).

The following wiring instruction connects the dc supply voltage onto the ac (low voltage) input so that the Mains on LEDs on both the MAF/PSU and Controller PCBs are illuminated. Because this signal is not ac, the Controller interprets that as a ‘Mains Fail’ condition and automatically disables the charger monitoring and automatic battery test, so that the latter does not have to be disabled by programming (but can be if desired).

With no mains (ac) present the real time clock (RTC) on the Controller Display will use the crystal time base instead of mains 50Hz and will therefore not be as accurate.

WIRING

Disconnect the secondary wires of the transformer from the AC IN tabs on the MAF/PSU. Cable tie them safely out of the way (if the mains is not connected they will not be live).

Connect the DC supply –ve to the BATTERY – terminal, and the +ve to the BATTERY + and, if the mains power on LED is to be lit to the J3/1 AC IN tab on the MAF/PSU. This requires a 2mm crimp receptacle (or alternatively may be soldered and preferably covered with sleeving).

If the maximum alarm load can be greater than 3.5Adc, but less than 7A, fit a second PTC (Vigilant part RR0917) to the R43 position on the MAF/PSU (adjacent to the existing PTC, R42). If the alarm load can be greater than 7A then short out the PTCs (connect TP16 to TP11) and fuse the external supply with a sufficient rating to meet the maximum alarm load, but not so high as to not blow on a short circuit or wiring fault.

The +VNBF output (J7A) must not be used.

CURRENT CALCULATIONS

Add an extra 80mA to the stated F3200 quiescent and alarm currents if the connection to the J3/1 AC IN terminal is made.

PROGRAMMING

With an external DC supply the F3200 should be programmed with mains disabled and “Fault after 8 hours of Mains Fail” also disabled.

With default programming, a Battery Low Fault will occur if the supply voltage falls below the specified threshold. This may be disabled by programming. (The installer must consider the requirements for a fault warning at 50% of battery capacity).
4.4 LINKS ON PCB MODULES

4.4.1 CONTROLLER/DISPLAY
Apart from E2INIT (SW1) and DATABASE WRITE PROTECT/ENABLE (Lk7) all links on the Controller Display are factory set. (These configure the PCB for memory chips used, other functions, and type e.g. as a FIP Controller or an RDU Controller).

SW1 and Lk7 are described in LT0256.

4.4.2 MAF/PSU
Of the 4 links on the MAF/PSU, 3 are for field adjustment as follows:

Lk2-Lk4 Bells/ANC 3 - Fitted in factory to provide switched 24V output. (Bells+, Bells-) to drive the Warning System.
- Snip all 3 for clean changeover contacts (NO, COM, NC).

Note that Lk2-Lk4 must remain fitted to provide the required supervision of the Warning System. No links are required for Ancillary Relay 1 and 2 supervision as these have a separate 'Sup' terminal.

One is for factory configuration as follows:

Lk1 Master/RZDU - Fitted for Master.
- Snipped for RDU (3-wire isolated connection to FIP).

4.4.3 8 RELAY MODULE
The 8 three position links (Lk1-Lk8) select load supervision for each relay.

U <-> unsupervised (voltage free)
S <-> supervised

Note that in addition to setting the Minijump for supervision, supervision must be enabled during programming (default).

4.4.4 16 ZONE LED DISPLAY
The last Display Bd in the chain (i.e. in furthest left position as viewed from the front) requires the Minijump provided to be fitted to Lk1.
CHAPTER 5
INSTALLATION & WIRING
5.1 INSTALLATION

5.1.1 CABINET INSTALLATION

The location of the F3200 FIP is chosen by the Fire Authority and building owner (or owner’s representative) in accordance with the Australian Standard AS1670.1.

If the cardframe needs to be made removable to allow fitting/removing of large batteries, this should be done prior to cabinet installation. (Refer to Section 5.1.2).

The cabinet is normally fixed to a wall with four 6 mm screws or bolts. The drilling details are shown in Fig 5.1.1.

The following conditions are required:

1. Dry Area, moderate ambient temperature, 45°C absolute maximum.
2. Not exposed to direct sunlight.
3. Not subject to outdoor conditions without suitable protection.
4. The LCD should be at average eye level and must not be higher than 1850 mm or lower than 750 mm above floor level (see Fig 5.1.1).
5. Clear access and viewing for Fire Fighters and operators.
6. At least 1 metre free space should be provided in front of and on sides of the FIP for installation and maintenance.
7. Must not be installed in hazardous areas as defined in AS3000.
8. If recessed into a wall:
   i. Allow for the door to open at least 145°.
   ii. Prevent water entering the cabinet - seal unused knockouts and any top cable entries. Preferably use bottom cable entry, with cables going down 100 mm below cabinet before rising.

It should not be necessary to drill within the cabinet, but if drilling or filing is required, remove the PCBs first. **Clean out all swarf before replacing the PCBs.**

**WARNING**
The F3200 is a Class A product. In a domestic environment it may cause radio interference in which case the user may be required to take adequate measures.

FIP CABINET MOUNTING DETAILS
5.1.2 CARDFRAME INSTALLATION

A KT0072 Cardframe upgrade kit can be fitted to a 15U F3200 to allow it to take more than three 8 way modules.

1. **If the system does not require large batteries** (refer to Section 4.3.4) it may be fitted as follows, using a pop rivet gun and M4 nut driver. With FIP power not connected, batteries not fitted.

   1. Remove the gear plate.
   2. Remove all 8 way modules.
   3. Remove the 3 sets of PCB standoffs on the left side rear of the plate.
   4. Remove the M4 nuts, washers and PCB spacers from the 3 M4 studs on the left side of the plate.
   5. Fit the Cardframe over the studs with the M3 bushes on the right hand side.
   6. Refit the 3 PCB spacers, washers and nuts on the inside (do not yet fully tighten).
   7. From the plate rear, with the Cardframe firmly against it, insert the 3 pop rivets provided into the holes in the Cardframe, and rivet.
   8. Tighten the M4 nuts on the studs.
   9. Refit the gear plate to the cabinet.

2. **If a system requires the Cardframe to be removable to allow the fitting/removing of larger batteries**, then the procedure is similar to that described in 1a above, but, instead of pop rivets, M4 screws should be used as follows:

   1. Use three M4 x 10 or M4 x 12 screws, with nuts, and shakeproof washers.
   2. Fit the screws with the heads to the rear of the gear plate, washers and nuts inside the Cardframe.
   3. Put some Locktite (or equivalent power glue) under the heads of the screws (but **not** on the threads).
   4. Tighten the nuts on the screws initially holding the heads of screws.
   5. Subsequent removal of the nuts (after the Locktite has dried) should be possible without removing the gear plate.
5.1.3 MODULE INSTALLATION

The 8 Zone Modules and any 8 Relay Modules are fitted in order, from top to bottom. The FRCs fit under each PCB, from BUS OUT of the top one to Bus IN of the next one (see Fig 5.1.2).

Observe the following:

(a) When mounting to the cabinet the M3 mounting screw per module should be tightened firmly to earth the module.

(b) Modules and FRCs need to be fitted one at a time in the Cardframe. It is easier to start from the bottom module and work up.

(c) Care should be taken not to scrape an FRC against the bottom of the PCB above it.

(d) There are redundant slots in the Cardframe to allow for either 6 module even spacing or 8 module even spacing. Choose the correct slots.

(e) On the Cardframe finger tighten the single M3 screw firmly into the notch in each PCB as this earths the module.

FIG 5.1.2
MODULE CONNECTION WITHIN A CARDFRAME
5.1.4 **LED DISPLAY INSTALLATION**

When LED Displays are required, the 7U inner door (ME0060) or 4U 80 zone door (ME0457) can be fitted to the standard cabinet directly below the 4U Operator Display with the M6 screws, washers and cage nuts provided. The hinge is on the right hand side. Click the cage nuts in from the inside. (7U doors cannot be fitted to a small cabinet.)

The flat M6 washers have a sharp edge and a rounded edge. Fit washers to the screws with the rounded edge facing the metalwork (to avoid damaging the paint.)

The Display Bds mount to the inner door on the standoffs supplied. FZ3031 for LH position, FP0475 for others, both include the PCB, standoffs, FRC, power leads, diffuser and label master for ME0060. Use FP1002 when using the ME0457 4U 80 zone display.

Fit the FRCs and Minijump link as shown in Fig 5.1.3.

It is recommended that the LED Display power leads from the MAF/PSU be fitted when more than 8 Display boards are fitted.

---

**FIG 5.1.3**

DISPLAY BOARD CONNECTION

---

Note that a special 26-way FRC loom (LM0092) is required to connect the first Display Board to the Controller Board. It has one 34 way FRC connector and is included in the F3200 LED Display Kit (FZ3031). Other options are LM0339 (220mm) and LM0335 (900mm).

For an NDU in New Zealand mode, if a NZ Display Extender board is fitted then it is added to the end of the display board chain after the last 16 zone display board (if any) and link Lk1 on the last 16 zone display board must be NOT fitted. The NZ Display Extender does not
need a link fitted to it, its presence indicates to the NDU that it is the last board in the chain. When programming the number of Display Bd, the Display Extender is not counted, but is individually programmed as fitted/not fitted. Refer also to Section 5.12.

The Unprotected Termination board, PA0483, connects to the NZ Display Extender via FRC. The NZ specific wiring connects to this Termination board.

Note the 2 LED Display boards (FP1002) do not have a link to be installed on the last board, nor do they have a mimic output connector to drive mimic displays or relays. One LM0339, as above, and one 270mm FRC extender for adjacent boards is included. Others need to be purchased separately. LM0339 is typically too short for F3200, and an LM0092 (1.2m) is more suitable.

**Extended LED Displays**

F3200 has an upper limit of 64 zones so requires only 4 LED display boards, if used. An NDU may be required to display more than 64 zones.

In larger systems, with more than approximately 12 LED display boards (192 zones), there is an increased possibility of spurious LED operation. The problem has been described as "leakage" from an indicator that should be on to other indicators near to it, which may flicker on and off instead. This is most noticeable on a large system with a number of isolated zones.

This problem can be fixed by fitting a Display Clock Buffer between the F3200 and the first LED display board.

**Mounting and Connection**

The Display Clock Buffer can be mounted adjacent to the Controller board or adjacent to the first zone display board, whichever is most convenient.

The Display Clock Buffer circuit board has the same mounting footprint as an IOR Unprotected Termination Board. If there is a mounting footprint for this in a convenient place, through-chassis PBR06 standoffs (supplied) should be used. If there is no other option, the adhesive base standoffs (also supplied) can be used instead.

The included LM0339 is used to connect to Controllers with a 34-way display connector (newer F3200/RDU/NDU/NLDU, or LED-RZDU), as shown in Figure 5.1.4 below.

![Connection to F3200 Controller with 34-way display connector](image-url)
5.1.5 ZONE LABELLING

For ME0060 zone labelling for the LED Displays can be done simply using LB0298.

The type format is:

(a) 6 lines per inch.
(b) 20 characters at 10 CPI or 24 characters at 12 CPI.
(c) 2 lines per zone window.
(d) 1 line between each zone window.

To install the zone naming label:

(a) Cut out the label as shown on LB0298 and slide into the appropriate slot on the rear of the ME0060.
(b) Insert blank labels into unused positions.

For ME0457 use the LB0600 supplied with ME0457 or LT0369 as a Word template file.

The format is up to 15 characters on two lines. Cut out the label and slide into the appropriate slot on the rear of the ME0457.
5.2 FIELD WIRING

5.2.1 GENERAL

Cabling should comply with all the points in AS1670.1, Section 3.24. Note the requirements for segregation and identification.

The cabling should, in general, be of not less than 0.75mm² cross sectional area, insulated and have red PVC sheathing. Joins should only occur in enclosed terminal boxes, and it is important that all terminations be good. I.e.

- no bare wire protruding from the terminal;
- no insulation inside the clamp part of the terminal;
- wire not cut or "nicked" during stripping;
- wire not soldered;
- wire not "doubled back" in the demountable terminals with leaf type strain relief clamps;
- all terminals firmly tightened;
- neat service loop;
- goose neck where servicing requires cable movement;
- coil of spare cable in wall/ceiling to allow for mistake/alteration.

Note that it is best to carry out parts of the initial survey during installation, in particular, resistance and insulation testing.

**WARNING**

Apart from the Mains supply to the FIP, **only ELV cabling should enter the cabinet.**

![Diagram of Screw Terminal Cable Connection]

**FIG 5.2.1**

**SCREW TERMINAL CABLE CONNECTION**
5.2.2 MAINS WIRING

The mains (240Vac) supply must be connected in accordance with AS1670.1 and AS3000 regulations.

Ensure the mains cables to the FIP are isolated at the Distribution Board before connecting to the FIP.

The mains cable connects to the 3 way terminal block mounted to the cabinet rear behind the mains cover.

(a) Remove the mains cover with a Pozi screw-driver.

(b) Shape the mains cable to fit through the grommet in the slot in the top of the cover, cut to length and strip only 20mm of the PVC cable sheath.

(c) Connect the wires: blue (black) to N, brown (red) to A, green/yellow (green) to E

Take care when stripping not to "nick" wires.

(d) Cable tie the cable to the cabinet.

(e) Refit the mains cover.
5.3 AZC WIRING

Detectors must be installed and wired as per AS1670.1. Observe the requirements for conductor type and size.

Connection to the particular MCPs, detectors or bases must be as specified by the manufacturer. Similarly for remote LED connection.

AZCs must be wired as per Fig 5.3.1 with "In" of the first detector connected to the 8ZM, and the EOLR to the "out" of the furthest detector.

Examples of illegal wiring are shown in Fig 5.3.3.

![DIAGRAM](image)

**FIG 5.3.1**
CORRECT AZC DETECTOR WIRING

The Tyco SU0600 MCP may be used on a circuit that has detectors on it, so that activation of the MCP does not reset the indication on any already activated detector. Wiring of the SU0600 is shown in Fig 5.3.2. The zone must be programmed with B3 = Instant Alarm.

![DIAGRAM](image)

**FIG 5.3.2**
TYCO SU0600 CONNECTION

Note that a 47 ohm resistor is required between the F3200’s AZC +ve terminal and the detector circuit when any T614 (Mk1), 4098-9618EA, 4098-9619EA or 4098-9621EA heat detectors are present on the circuit (refer PBG0116).
FIG 5.3.3
EXAMPLES OF INCORRECT AZC WIRING
5.4 MAF ANCILLARY RELAY WIRING

The original (AS1603.4) F3200 has a single Warning System output and Isolate Switch, namely the Anc3/Bells relay, configured as Bell+-, and the “Bells Isolate” key. It is now typical for FIPs to control two outputs, i.e. a single External Bell (or Strobe), and a separate building Warning System that produces tones to AS2220 or ISO8201.

The MAF module has 3 Ancillary Relays. Typically, Anc 1 is used for door holders, air-conditioning shutdown etc.; Anc 2 is used for the External Bell; and Anc 3/Bells is used for the Warning System. Wiring of the External Bell should be as per Fig 5.4.2 using Anc 2. The Warning System is covered in Section 5.5. Anc 1 and Anc 2 each have 1 set of voltage free contacts available on screw terminals, and a second set to which the screw terminals are not fitted as standard. Where supervision of wiring is required, the supervision (SUP) input is used as shown in the following figures.

Door Holder Wiring

Door holders are typically powered through normally closed contacts from the non-battery backed supply (+VNBF). As door holders are inductive, a suppression diode should be fitted between 0V and the door holder positive line.

Where door holders have individual manual release buttons, suppression should be fitted at each device.

| Observe polarity, the cathode of the suppression diode is connected to the positive line. |

Where supervision is required, the recommended connection is as shown in Fig 5.4.1 A or B with a return from the furthest door holder. The alternative shown in Fig 5.4.1 A does not supervise the loop.

The 24V relay used at the end of the loop in Fig 5.4.1 B only needs to switch low current.

"Door Holder" mode supervision "looks for" the presence of voltage when the ancillary relay is de-energised.

Plant Relay/Solenoid Wiring

Where a plant relay is to be energised on Ancillary Relay operation it would typically be powered through normally open contacts from a battery-backed supply.

If wiring supervision is required, it is connected as shown in Fig 5.4.2. "Load" mode supervision looks for a resistance to 0V when the ancillary relay is de-energised. For a very low resistance load (ref Specifications Section 3.4.2) a series diode must be fitted as shown.

Heavy Load Wiring

If a load greater than 2A resistive (1A dc inductive) needs to be controlled by F3200 then this can be achieved with the addition of a 24V Bell Monitor Board (PA0494). This can switch up to 5A dc (resistive) and supervises the load wiring for open and short circuit faults.

Further details for the Bell Monitor Board are contained in LT0190. A representative wiring diagram is shown in Figure 5.4.3. If the load exceeds 2A dc then the power connection must be taken off +VBF2 or directly off the battery terminals via a suitable fuse (but not the +VBF1 terminal). The fuse and wiring are supervised by the Bell Monitor Board, as it will generate a fault if power to it fails.

**WARNING**

Apart from the mains supply to the FIP only ELV wiring may enter the cabinet.

Relays must switch only Extra Low Voltage (ELV) signals.

EXAMPLE OF PLANT RELAY WIRING WITH SUPERVISION

**FIG 5.4.3**
EXAMPLE OF SUPERVISING MULTIPLE BRANCHES OF MULTIPLE LOADS
## 5.5 WARNING SYSTEM WIRING

The typical configuration allocates the Ancil 3/Bells relay to drive the Warning System, and has links Lk2-4 fitted so that a switched 24V output is available at the +/- terminals. The supervision allows for up to 3 branches of wiring, with each requiring its own end of line resistor (EOLR). The value of the EOLR varies with the number of branches such that the combined total is always 3K3. The EOLR must be fitted at the end of each branch.

<table>
<thead>
<tr>

</tr>
<tr>
<td>3</td>
<td>10k</td>
</tr>
</tbody>
</table>

The Ancil 3/Bells output can be used to directly control alerting devices such as sounders (that generate tones to AS2220 or ISO8201), AVIs, strobes etc. If each device does not have an internal series diode then a series diode must be fitted at each device, as shown in Fig 5.5.1. The diode must be rated to carry the current of the device.

The AVI Mk2 includes a series diode and multiple units can be connected to a common line, be supervised, and have the synchronisation wire inter-connected. Note the original AVI (FP0628) requires an external series diode to be fitted at each device for a supervised circuit. Multiple original AVIs cannot be synchronised because the sync line carries the signal and is not supervised.

The Bells +/- output is limited to 2A dc resistive max. (Note that loads such as AVIs, Mini-Gens are considered resistive, whereas loads such as Solenoids and bells are inductive). A load of up to 5A dc resistive can be accommodated by use of a Bell Monitor Board and a separate, 6A dc, inline fuse. See Fig 5.5.

A relay on an 8 Relay Module can also be used to control and supervise a circuit of evacuation devices. This is described in Section 5.6.3.

The Ancil 3/Bells relay can also be used to activate (and supervise) external tone generation devices such as Mini-Gen, T-GEN 50, Microvac and QE90, and the ISO 8201 Strobe Driver Module. This is covered in the following sections.

### MINI-GEN

The Mini-Gen has an internal diode and can be connected on to the Ancil 3/Bells output with up to three branches of speakers as per the instructions included with each unit. The 10k EOLR fitted to each speaker line must be rated at 2W and is supplied with the unit. Refer Fig 5.5.2. If less than 3 branches are required, the 10K 2W is still fitted to the end of each branch, with the other EOLRs being fitted to the +/- dc input terminals of the furthest Mini-Gen. Refer to the instructions.

The Mini-Gen can be link selected to produce an Alert tone, an Evac tone, an automatic change from Alert to Evac after 1 minute, or an automatic change after 3 minutes. If desired, it can be configured to produce Evac, with a relay switching the tone to Alert. For this, a mini-jumper is fitted to link V, and the supplied 3 way connector fitted to link A/B with normally closed relay contacts shorting pin 2 to 3 (position B) to produce Alert. When the contacts open, the tone will change to Evac. Note that this applies only to Mini-Gen Rev 3 bds with V2.00 or greater software, and for internal wiring of the relay to the Mini-Gen (i.e. the Mini-Gen must be mounted within, or adjacent to the FIP.)

A relay output on 8 Relay Module can also be used to drive a Mini-Gen. Refer to Section 5.6.2.
T-GEN 50

The T-GEN 50 is permanently powered, requiring a supervised Alarm- signal from the FIP rather than switched power. The BELLS- terminal can be used for this, refer Figure 5.5.6. Alternatively, an Ancil relay on the MAF, or an 8RM relay can be used as per Sections 3.4 and 3.5 of the T-GEN 50 Installation Instructions, LT0186. The +VBF2 is recommended for providing +24V to the T-GEN 50 as it is fused at 6A.

Note that a 2k5 ELD (3k3 and 10k 1% in parallel) must be used for the BELLS relay, when connecting to the ALM- input on T-GEN 50. Configure the T-GEN 50 to NOT supervise its ALM- input (SW4 off).

Alternatively, an open collector output could be used, but the T-GEN 50 will need to supervise its ALM input and be fault supervised via an unused F3200 circuit input.

The Auto/Isolate/Evacuate switch provided with the T-GEN 50 (but not fitted), should not be used as the F3200 already has an isolate facility using the Warning System Isolate.

MICROVAC AND QE90

The Anc 3/Bells output can be used to activate a Microvac/QE90 and to supervise the link for a fault condition. A 24V relay (e.g. PA0730 General Purpose Relay Bd) is required to be mounted within the Microvac/QE90, and the wiring as shown in Fig 5.5.3.

Alternatively the Anc 3/Bells output can be made voltage-free (remove Links 2, 3, 4 on the MAF) and a spare 8 Zone Input can be used to supervise the Microvac/QE90. This arrangement, shown in Fig 5.5.4, does away with the relay, but requires a 4-wire connection and one spare input. The input should be programmed as a status-only zone and the fault state included in the logic equation to generate a Warning System fault. E.g. for zone 16 WSF = Z16F.

A high level link can be achieved between the F3200 and QE90 using the RZDU communications output. This is only suitable for when the F3200 and QE90 are co-located, as there is no duplication of the cable. Details for this wiring are contained in the QE90 Installation and Commissioning Manual LT0088. In addition, the QE90 needs to be supervised for a fault condition. This can be done as shown in Fig 5.5.4 using a spare zone input or as in 5.5.3 using the Ancil 3/Bells output supervision.

ISO 8201 STROBE DRIVER

The ISO 8201 Strobe Driver Module can be controlled by the F3200 Bells/Anc 3 relay output as the Mini-Gen is done in Figure 5.5.2. In fact both a Mini-Gen and a Strobe Driver could be controlled at the same time using the relay output as long as the total load current is within allowed limits.

Note the 10k EOL is used on the strobe circuit, but it does not need to be a 2W resistor.

It can also be controlled by using an 8 RM relay output as per Section 5.6.2. Further details are contained in the Strobe Driver Installation Instructions.

5.6 MODULE RELAY WIRING

The 8 Relay Module relays each have one set of voltage free change-over contacts (i.e. one pole) accessible via screw terminals, to switch plant equipment. The second pole of each relay can be accessed by fitting a 3-way de-mountable connector block pair CN0488 and CN0260.

There are two sets of four inter-connected, voltage free, looping terminals per module that can be used for looping supplies onto relays or loads. If the load switched is inductive e.g. a solenoid coil, a suppression diode must be fitted as shown in Fig 5.6.1.

Supervision

Supervision of the field wiring from the FIP to the load is shown in Fig 5.6.1. This only works for a single load, or multiple co-located loads wired in parallel (though for multiple co-located loads, the supervision will not detect a fault if one load becomes disconnected). It requires the load or an EOLR to be connected between the relay COM terminal and the FIP 0V, and the supervision link on the module to be fitted in the "S" position. If the COM output does not ‘see’ a supply voltage or open circuit when the relay is activated (requires V2.09 or greater software), then the relay must be programmed to not supervise the load when activated.

An example of supervising a circuit of multiple, separately located loads using 2 poles of one relay is shown in Fig 5.5.3.

Note: For a load of less than 400 Ohms a diode of suitable current rating must be wired in series with the load at the load as shown in b. below.

FIG 5.6.1 EXAMPLES OF MODULE RELAY WIRING WITH SUPERVISION
5.6.1 DUAL POLE – POLARITY REVERSAL OUTPUT

Two relays; or 1 relay, an open collector output and an external 2 pole relay (e.g. PA0730); can be arranged to provide a supervised dual-polarity output suitable for driving dual strobes (Alert and Evacuate) or some visual warning devices (e.g. an AVI). The output is normally off (supervising voltage only), but can turn on with 24V in one polarity or in the other polarity. This is shown in Figure 5.6.2.

If the dual pole relay is a second 8RM relay then the additional connector blocks need to be fitted (CN0260 and CN0488). Supervision is not enabled on this relay. The supervision on the other relay will detect any short circuit, but may not detect an open circuit with multiple sets of strobes/AVIs. This will depend on the type of strobe/AVI and the quantity remaining connected.

The relay should be programmed to operate when either strobe is required, and the open collector output (or 2nd relay) is programmed to operate for Evacuate.

Note that many strobes have a large capacitor inside them that causes a large in-rush current at power on. Therefore it may be necessary to add some series resistance if the cable length to the first set of strobes is not enough to limit the current. Add 10-20 ohms for a total strobe current of <100mA, 8-10 ohms for 100mA, and 2 x RR1007 NTCs in series for 300mA-1A.

Further details are contained in PBG0072A for using this to control a T-GEN 50 as well, or to include an Auto/Isolate switch that can activate the strobes as well as the T-GEN 50.
5.6.2 DRIVING MINI-GEN OR ISO 8201 STROBE DRIVER

A relay output of an 8 Relay Module can be used to control and supervision up to 2 Mini-Gen or ISO 8201 Strobe Driver modules.

One of a number of different wiring methods can be used, depending on the parts available to adapt the 8 Relay output to provide the required signals and the number of Mini-Gen / Strobe Driver modules connected.

Figure 5.6.3 shows using one relay output and wiring to the SUP+ pin of the 3 way Supervised/Unsupervised link pins of the output. This requires soldering or a crimp tool to crimp the supplied connector onto some 0.1mm²-0.35mm² wire, to make the connection to the SUP pin.

Only one Mini-Gen or Strobe Driver module is allowed on this arrangement. However, single or dual speaker/strobe branch wiring can be supported. The Mini-Gen/Strobe Driver must be located in the F3200.

It is recommended that 2 x 27k EOL resistors are used. If there is only one branch, fit one resistor at the end of the wiring, the other at the Mini-Gen/Strobe Driver output terminals - so that it can be moved to the end of a second branch if it is added later. If there are two branches, fit a 27k at the end of each branch.

Program the relay output as supervised and select Supervision Enabled during the activated state.

Solder or Crimp Pin

FIG 5.6.3 USING 1 RELAY OUTPUT WITH 1 MINI-GEN/STROBE DRIVER IN 4-WIRE MODE
Figure 5.6.4 shows using 2 poles of one relay output to control and supervise 1 or 2 Mini-Gens or ISO8201 Strobe Driver Modules. The CN0260 and CN0488 connector parts are required to provide the 2\textsuperscript{nd} pole of the relay.

Fit the Supervision link on the 8 relay module.

If using 2 Mini-Gen/Strobe Driver modules they must be co-located.

Use 2 x 27k EOL resistors. If there is one Mini-Gen/Strobe Driver and one branch, fit one resistor at the end of this branch and the other across the Mini-Gen/Strobe Driver + and – DC terminals. If there are two branches, or two Mini-Gen/Strobe Drivers (with one branch each) then fit one 27k resistor at the end of each branch. Program the relay for supervision enabled and set Supervise in the Activated state to NO!
Figure 5.6.5 shows using two relay outputs to control and supervise 1 or 2 Mini-Gen or ISO8201 Strobe Driver modules.

2 x 27k EOL resistors are required. If only one Mini-Gen/Strobe Driver is fitted, put one EOL at the end of the field wiring and the other across the DC IN +ve, -ve terminals. If two branches or 2 Mini-Gen/Strobe Drivers are used (1 branch each) put the EOL at the end of each branch.

Program the first relay as supervised and the 2nd relay as not, with both relays activated by the same logic. Also the first relay must be programmed so that supervision is disabled when the relay is activated.

![Diagram of relay connections](image-url)

**FIG 5.6.5**
**USING 2 RELAYS WITH 1/2 MINI-GEN/STROBE DRIVERS**
5.6.3 CONTROLLING EVACUATION CIRCUIT DIRECTLY

Two poles of a relay on the 8 Relay Module can be used to directly control a circuit of 24V evacuation devices (sounders, AVI Mk2s, etc).

This requires the CN0260 and CN0488 connector parts to be soldered in to the spare relay pole position.

Figure 5.6.6 shows the wiring for this. Pole 1 is the connector terminals fitted as standard and Pole 2 is the spare set soldered in.

Note the relay output must be programmed so that supervision of the wiring is disabled when the relay is activated (ACT = No). It is suggested 2 x 27k EOL resistors be used. Place two in parallel if only one branch is used, and 1 at each end of two branches.

Note that this configuration requires that the relay confirmation (ACT) be disabled.

FIG 5.6.6
EXAMPLE OF A SUPERVISED EVAC CCT USING 2 POLES OF AN 8RM RELAY
5.7 OPEN COLLECTOR WIRING

5.7.1 LED MIMIC DISPLAYS

It is expected that the most common use the open collector outputs will be to switch LEDs on "mimic" displays. These outputs are approved for field connection, so may be used to "drive" remote mimics. Typical connection is shown in Fig 5.7.1.

5.7.2 INTERFACING TO OTHER EQUIPMENT

Where the open collector outputs are used to switch inputs to other systems, such as an Evacuation System or Plant Computer, there are two main options as follows:

1. **Direct Coupling**

   The open collector output switches the equipment input to less than 1V (typically 0.6V at 1mA). E.g. it may be used to switch a 5V CMOS input, or monitored 5V, 12V or 20V input. Refer to Fig 5.7.2.

   Note that for this to work, the 0V supply of the equipment must be connected to the 0V supply of the FIP. This may not be desired, especially if the equipment has a power supply connection to earth.

   Note also that the open collector output has protection diodes to the FIP positive and negative supplies and should not connected to inputs that could be "pulled" to a voltage above or below these supplies, even with mains failed and battery voltage low.

2. **Isolated Coupling**

   The open collector output can be used to switch a relay, or an optocoupler as shown in Fig 5.7.3. When the open collector is "on", the optocoupler transistor is also "on".

Further details are contained in PBG0072A for using this to control a T-GEN 50 as well, or to include an Auto/Isolate switch that can activate the strobes as well as the T-GEN 50.
FIG 5.7.2
EXAMPLE OF INTERFACING TO OTHER EQUIPMENT, DIRECT COUPLING

FIG 5.7.3
EXAMPLE OF INTERFACING TO OTHER EQUIPMENT, OPTICAL ISOLATION
5.8 ASE INSTALLATION AND WIRING

A Centaur ASE may be mounted in an F3200 panel or an NDU in a large cabinet. Two kits are available, namely KT0199 and KT0212. Both are 3U hinged front panels accommodating 1 or 2 ASE or V-Modem units (or a combination) respectively. The kits include mounting parts and fitting instructions.

The ASE should be wired directly off the battery via its own fuse. Wiring of the ASE FP0740 EOL unit is as per the ASE installation instructions. The red wires are wired across the MAF Alarm relay NC and C terminals, the yellow wires across the MAF Fault relay NC and C terminals, and the blue wires across the MAF Isolate relay NC and C terminals. No other connections to these relays are permitted when the ASE EOL unit is used.

Locating the ASE remote from the panel has additional requirements under AS4428.1 (Clause 2.10) that currently cannot be met.
5.9 RDU WIRING

A FIP may drive up to 8 Remote Display Units (RDUs) that are programmed to send information back to the FIP. More “monitoring only” devices may be connected to the FIP RZDU Tx line. Some RDUs have their own power, but others require their power (24Vdc) to be supplied from the FIP or an approved PSU with battery backup.

The RDUs are all connected in parallel on common Tx and Rx circuits. Star and Bus wiring connections are permitted as shown in Fig 5.8.1.

NOTE: TX from the FIP goes to RX on ALL RDUs

RX from the FIP goes to TX on ALL RDUs

Fig 5.8.1 shows an example of interconnection between both MAF and Non-MAF configured RDU(s) and the FIP.

NOTES: To maintain electrical isolation:

(1) Lk1 on the MAF/PSU Board should be cut for RDUs with their own MAF/PSU module.

(2) Non-MAF configured RDUs that are powered by a PSU other than the FIP must have Lk3 on the Remote Termination Board cut and Lk14 on the Controller in the “R” position.

Cable Limitations

The maximum distance to the furthest RDU is determined by the cable type used and the wiring arrangement.

(1) The MAXIMUM line resistance loop (FIP TX out, 0V return must not be greater than 150 Ω.

(2) The MAXIMUM inter-wire capacitance at the FIP RZDU terminals MUST NOT exceed 100 nF. This must be the total of all cables used - not just the length to the furthest RDU. Typically this is 1km of TPS cabling.

(3) The +V and 0V cables must be of sufficient size to avoid excessive voltage drops to RDUs when they are drawing maximum current (e.g. lamp test).
FIG 5.8.1
EXAMPLE OF RDU COMS WIRING
### 5.10 NDU INSTALLATION AND WIRING

#### 5.10.1 INSTALLATION OF 19" NDU

The NDU is available in a 15U cabinet; in slimline surface, flush and deep cabinets, and as a 19" rack mount kit (FP0794). Mounting of the 15U and slimline cabinets is covered earlier and the FP0794 must be installed as follows to meet the EMC requirements.

Using the RS485 board as a template, drill 4 x \( \phi 3.5 \)mm holes and deburr. Scrape away any paint on the inside face and mount the metal standoffs using 4 M3 x 6 screws and shakeproof washers. Mount the RS485 board onto the standoffs using M3 x 6 screws and M3 crinkle washers. Mount the 4U inner door onto the 19" rack and earth to the cabinet using the earth lead supplied.

Run the 10 way FRC from J7 (Network 1) on the Controller to J1 on the RS485 board, keeping it tight against the cabinet metalwork by using FRC clamps. Run +24V to the J5 terminals on the Controller, and the network cables to J3 on the RS485 board. Connect any screen on the network cables to the 0V ISO terminal on the RS485 board.

#### 5.10.2 MCP CONNECTION

An NDU with a MAF/PSU board has an MCP connected to pins 3 and 4 of J6 on the MAF/PSU board as standard.

A slimline NDU has the facility for connection of an MCP, but the MCP has to be mounted on the wall, immediately adjacent to the NDU. Connection is made to pins 3 & 4 of J5, the 4 way "Spare Input Connector" on the NDU Controller/Display Bd. The wiring to the MCP is detailed in Fig 5.10.1 for Australia.

An MCP should not be connected in NZ mode as an indicator is not included.

![MCP Connection Diagram](image)

**FIG 5.10.1**

MCP CONNECTION FOR NDU, AUSTRALIAN MODE
5.11 NZ MODE INPUTS AND OUTPUTS

5.11.1 GENERAL

New Zealand mode operation may be enabled on an NDU but not on an F3200 fire panel.

An NDU with New Zealand mode enabled may be connected to a Panel-Link network of panels which also have "New Zealand" mode enabled. The NDU may be used with or without a MAF board, and optionally with a NZ Display Extender board.

If a MAF board is used, the NDU could be used as the main brigade connection point of the network (but this is not recommended due to difficulties in arranging the brigade index (refer Section 5.12). The MAF board has relays for signalling alarm, fault and standby (normally energised and normally wire-ORed with fault). The MAF board also provides a supervised BELL relay, two supervised ancillary relays, and an "isolate" relay; all of which can be controlled by output logic if desired.

5.11.2 NZ DISPLAY EXTENDER BOARD

The NZ Display Extender board, if fitted, is positioned at the end of the LED Display Board chain (the last LED Display board should have Lk1 removed), or connected directly to the controller J13 via an FRC (LM0092) if there are no LED Display Boards.

The New Zealand Display Extender board has the following inputs and outputs, accessible on the PA0483 Termination board, as shown in Fig 5.11.1.

**Inputs** (all active low)

- Trial Evac/Sprinkler operated (separate terminals, but internally connected)
- Silence alarms
- External defect
- Lamp test
- Building services restore
- Brigade test/brigade isolate (shared)
- Evac defect

**Outputs**

- Fire LED
- Defect LED
- Normal LED
- Ancil defect
- Ancil fire
- Lamp

**Evac Defect/External Defect**

The Defect and External Defect inputs may be programmed as to whether a defect is signalled for them or not. If defect is not signalled then they can be used as general purpose inputs accessible in output logic.

**Building Services Restore**

When the Building Services Restore input is activated, the BSR logic token is set true and this can be used in output logic to turn outputs off or on if necessary.
DISPLAY EXTENDER BOARD (CONTINUED)

Trial Evac

When the Trial Evac input is activated, the Bell relay is energised and the BEL logic token is set true regardless of any silence alarms or bells isolate condition.

Silence Alarms

When the silence alarms input is activated, the Bell relay is de-energised and the BEL logic token is set false unless trial evac is asserted.

Brigade Test/Brigade Isolate

These conditions share the same input and when true, result in an “abnormal” system state (but defect is not signalled) that can be recalled with a system fault recall.

Lamp Test

This input can be used to test all the LEDs including the front panel LEDs, the LEDs on the New Zealand Display Extender board, the index lamp and any 16 zone LED display boards.

FIG 5.11.1
NEW ZEALAND EXTENDER TERMINATION BOARD
5.12 INSTALLATION : NZ DISPLAY EXTENDER BOARD & BRIGADE DISPLAYS

5.12.1 GENERAL

An NDU is not normally used as a brigade connection point. If an NDU is used as a brigade connection point then, in general, a separate display panel must be provided if there needs to be zone alarm indication to the attending Fire Brigade staff. The recommended way to provide this is to use an LCD-RZDU (PA1048) – refer LT0460, connected to the RZDU output of a panel or the NDU itself.

The following sections describe some suggestions on how to arrange LED displays and mimic outputs off the NDU itself. The common MAF status display is provided by mounting an NZ Display Extender Board (PA0499) in the NDU cabinet and wiring to a display in a separate cabinet in one of the ways shown in Fig 5.12.1 and 5.12.2.

Sixteen-zone display boards are not normally connected to an NDU, but the two diagrams show how they can be connected if necessary. An NDU allows a maximum of thirty three 16-zone display boards and each individual LED (48 LEDs per board) must be controlled using output logic or network zone to LED mapping.

The second cabinet is necessary because the LEDs mounted inside the NDU cabinet do not meet the requirements of NZ4512 with regard to visibility and viewing access. An NLDU (Network LED Display Unit) could also be used to drive 16-zone display boards and show individual zone information as part of the brigade mimic display.

Any Ancillary Control Zone indicators on this external display must be coloured differently or be segregated from the zone alarm and common indicators, and be clearly labelled.

There are several methods for providing a separate display panel. Two approaches are detailed below.

NOTE 1: The information provided here is very similar to the information in the RDU installation manual LT0449 which may be useful to refer to.

NOTE 2: If an NLDU is used to drive 16 zone display boards, then the NLDU user manual LT0188 must also be referred to.

5.12.2 MIMIC DISPLAY

A mimic display uses the mimic outputs from the NDU’s internal 16 Zone LED Indicator Boards to drive alarm LEDs in an external display. Each group of 16 zone alarms and the common indicators are extended in a separate 26 way FRC to the external display.

The number of FRCs between the NDU and the external display limit the practical separation distance. Since the cabling is not supervised in any way, the Fire Service or approving authority may place restrictions on this distance. The cable must be well protected mechanically by conduit, trunking or equivalent.
MIMIC DISPLAY (CONTINUED)

These parts are available for constructing displays of this type:

FP0475  FP 16 ZONE LED DISPLAY EXTENDER KIT (C/W LOOM)
FZ3031  16 ZONE LED DISPLAY EXTENDER KIT, RHS POSITION
LM0044  LOOM, DISPLAY EXTENDER FRC 2M 26 WAY
LM0045  LOOM, DISPLAY EXTENDER FRC 5M 26 WAY
        (Longer and 3-way looms can be made to special order)
LM0092  LOOM, CONTROLLER TO FIRST DISPLAY 1.2m
PA0483  PCB ASSY, IOR UNPROTECTED TERMINATION BOARD
PA0499  PCB ASSY, NZ DISPLAY EXTENDER BOARD
PA0769  PCB ASSY, 16 O/P MIMIC TERMINATION BOARD, C/W RESISTORS
        (As for PA0483 but 3k3 resistor per output)
PA0753  PCB ASSY, PICTURE FRAME DISPLAY, 16 LED MIMIC, 24V

A suitable cabinet will need to be constructed.

Various FP1600 empty cabinets and the PA0787 FP1600 Mimic Display Board provide an alternative format.

At the display panel there are two possibilities:

(i) Geographic Plan Mimic - the FRCs from the NDU are connected to Termination boards (PA0483). Individual LEDs with series resistors are mounted on the display panel and wired to these Termination boards. Figure 5.12.1 shows this arrangement. Alternatively, the PA0769 Termination Board has 3k3 resistors already fitted (gives 7mA LED current which is adequate for interior use).

(ii) Column Format - where arrangement of zone alarms into columns is acceptable, LED Mimic Display boards can be used. This simplifies the wiring considerably. Figure 5.12.2 shows this arrangement.

Note that a special 3-way FRC is required for the Display Extender board, so that the miscellaneous inputs are accessible in the NDU cabinet. This is not a standard part, and will need to be made up to suit the application.

5.12.3 PFD MK2 CABINET

The FP0967 PFD Mk2 cabinet can be used to hold 2 x FP1002 16 zone LED Display boards (32 zones), in either a front or rear service format. The index will need to be marked with the relevant zone descriptions. Cabling is as described for LED displays in Section 5.1.4.

Note the NDU will need to be mounted adjacent to the PFD cabinet as the FRC cannot be run externally. If a distance must separate these cabinets, use the PFD Termination board (PA0772) to provide screw terminals for a 12-way screened cable between the cabinets.

Note also the common Fire, Defect, and Normal LEDs will need to be specially arranged (either through logic to the zone 1 LEDs or use separate LEDs driven off the NZ Display Extender).
5.12.4 DISPLAY EXTENDER BOARD MISCELLANEOUS TERMINATION

The miscellaneous signals available through a NZ Display Extender Board are accessible via a 26 way FRC and PA0483 unprotected termination board. A termination pin out diagram is given in Fig 5.12.3. Refer to section 3 for electrical specifications of these signals, and to section 5.11 for their logical functions.

![Diagram of NZ Display Extender Board and External Mimic Display Cabinet]

Note: PA0769 Termination Board can be used instead of PA0483. PA0769 has resistors for LEDs already fitted to the PCB.

All shaded cables 26 way FRC.
The first cable from the NDU Controller must be LM0092 (FZ3031 kit)

FIG 5.12.1
REMOTE PLAN MIMIC DISPLAY
FIG 5.12.2
REMOTE MIMIC USING LED MIMIC BOARDS
5.13 NETWORKING

5.13.1 RS485 NETWORKING USING PA0773 RS485 BOARD

A network of up to 32 F3200 panels using dual copper wire pairs can be achieved by fitting the FP0795 F3200 RS485 Network Kit in each panel. This kit includes an RS485 board which is mounted on standoffs in the right hand side cabinet wall. It also includes installation instructions, looms and other hardware.

Where the panels have more than 10 zones or 250 devices/detectors duplicated paths are required.

5.13.2 I-HUB NETWORKING

The I-HUB is an intelligent network interface board that allows inter-connection of panels in a ring of copper wire pairs (using RS485 protocol) or fibre-optic cable with OEM fibre-optic modems.

Up to 64 panels may be connected to the ring.

The I-HUB has a direct TTL connection facility to the F3200 Controller, as well as two RS232 connections. Refer to LT0229 for detail.

The I-HUB is mounted on the standoffs on the inside of the right hand side cabinet wall. The I-HUB upgrade kit, FP0771, includes the I-HUB board, mounting hardware and inter-connection looms.

NOTE:

Sprinkler Operated and Trial Evac share the same input and are electrically connected on the Display Extender Board. On an F4000/MX4428, Input 10 is used as Brigade Test, and Services Restore (BSR) is not provided.
5.13.3  IP NETWORKING

For IP Networking of F3200 to other F3200 panels, MX4428 panels or other Panel-Link compatible devices, e.g., NDU, a PIB and one Moxa switch are required to be fitted in each panel. These provide 2 fibre optic paths that should be arranged in a ring. Each fibre path can be changed to using a copper pair by fitting an Ethernet Extender at each end of the cable.

Details on a convenient mounting bracket (FP1013) to mount the parts on the right hand side cabinet wall and wiring information from the F3200 Controller to the PIB are included in the PIB User Manual (LT0519).

The maximum number of F3200 panels that can be interconnected is 64.
CHAPTER 6
APPLICATIONS
6.1 AS1668 AIR CONDITIONING CONTROL

6.1.1 GENERAL

The following features of F3200 allow it to be easily adapted to make a Fire Fan Control and Indication Panel (FFCP) (referred to as AS1668 which is the relevant Australian and NZ Standard):

- 19" Rack mounting cabinet with standard light grey blank panels available, including 9½U (plastic), 7U metal (hinged), 4U metal, 3U metal;
- Standard module available which includes a PCB module (2 options) with switch and LEDs, a connector block for field wiring, and labels (see Fig 6.1.1);
- Programmable open collector output for driving LEDs (can enter logic equations for RUN, FAULT, STOPPED);
- Programmable relays for fan controls;
- Programmable time delays on duct sampling AZCs, with RAD and SAD options;
- Programmable AZCs for control inputs with two useable alarm states plus normal (plus faults) per AZC (i.e. logic equations can differentiate "manual" alarm (instant) from "detector" alarm (alarm);
- Programmable zones, allows non-latching, non-MAF (non-FF), non-Bells/Ancillaries, status only (i.e. Fan Control Panel output relays can switch AZCs and the corresponding zones can be programmed as "non-fire" zones with optional levels of "transparency" within the Fire Alarm System e.g. Faults, Alarms can be included/not included in the "totals" display and the "recalls").

The standard AS1668 PCB modules are held to the front panel (rear) by a nut on the threaded shaft of the rotary switch which is attached to the PCB. The LEDs are soldered to the PCB. The adhesive label is black on clear, and the standard panels are light grey.

The standard colours for RUN, FAULT and STOP (stopped) are red, yellow and green, respectively.

The KT0113 AS1668 Control Module kit is a convenient way of wiring up some of the circuit examples described herein. It comes complete with assembly instructions (LT0438) which include the wiring diagrams 1945-19-3 and 1945-19-4, also included in this section.

The 5 way AS1668 modules (ME0472, KT0478, KT0512) could also be used, but this would require special wiring of the FRCs to termination boards (PA0483) and then to inputs and outputs on the F3200 – refer to LT0368.

STOP  FAULT  RUN

OFF  AUTO  ON

FIG 6.1.1
STANDARD AS1668 MODULE PANEL LAYOUT
6.1.2 CIRCUITS & ZONES

FIP End Inputs

The "off", "auto" and "on" inputs from the AS1668 Control Module can be connected to 0, 1 or 2 AZCs as desired.

One AZC per fan control is cheaper, but does not allow the LCD zone text to display "fan off" and "fan on", though the fan name can be put in the zone text, and for options A and C following, the word "off" could be programmed as zone text so that "Manual" Alarm is "on" and "off" Alarm is "off".

For option B, the text LCD would display "fault" for "off". Zone text would normally only be viewed by a zone status recall as AS1668 control inputs will (generally) be programmed as "status" zones (i.e. non-FFCIF).

Figs 6.1.3 and 6.1.4 show both options. Option 1 requires a Zener diode or a resistor (e.g. 560E) to give B2 voltage.

Note that the option shown in Fig 6.1.3 B ("off" <-> "fault") corresponds to the standard KT0113 AS1668 Module circuits (see drawings 1945-19-3 and 1945-19-4) and so is the "preferred" option for using KT0113.
CIRCUITS & ZONES (CONTINUED)

The option in Fig 6.1.3 A could be implemented by "tacking" the 560E resistor (or 6V8 Zener) onto the PCB. The 2 AZC option (Fig 6.1.4) could also be implemented by soldering the extra resistor and wires onto the unused contact of the rotary switch on the PCB.

In all cases, "auto" is zone "normal".

A. WITH A ROTARY SWITCH, "ON" IS B1 (INSTANT), "OFF" IS B2 (ALARM).

B. WITH A ROTARY SWITCH, "ON" IS B1 (INSTANT), "OFF" IS FAULT.

C. WITH A CENTRE-OFF TOGGLE SWITCH, "ON" IS B1 (INSTANT), "OFF" IS B2 (ALARM).

FIG 6.1.3
FAN CONTROL SWITCH WIRING WITH SINGLE AZC
CIRCUITS & ZONES (CONTINUED)

For options A and C in Fig 6.1.3, configure circuit Alarm Text as "manual" and voltage band B1 as "Instant Alarm" (refer to table below).

<table>
<thead>
<tr>
<th>Voltage Band</th>
<th>Default State</th>
<th>Program State</th>
<th>Fan Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>B5</td>
<td>Fault</td>
<td></td>
<td>Switch wiring open circuit</td>
</tr>
<tr>
<td>B4</td>
<td>Normal</td>
<td>&quot;Auto&quot;</td>
<td></td>
</tr>
<tr>
<td>B3</td>
<td>Alarm</td>
<td>&quot;Off&quot;</td>
<td></td>
</tr>
<tr>
<td>B2</td>
<td></td>
<td>&quot;On&quot;</td>
<td></td>
</tr>
<tr>
<td>B1</td>
<td></td>
<td>Inst Alarm</td>
<td></td>
</tr>
</tbody>
</table>

Configure the zone as non-Latch, Status, non-Anc1/Warning System/External Bell.

In output logic, "off" is ZnD, "On" is ZnM, (for AZC number n).

For Option B in Fig 6.1.3, configuration is similar but in the output logic, "off" is ZnF and "on" is ZnA.

For two AZC inputs:

<table>
<thead>
<tr>
<th>Zone 1</th>
<th>Alarm</th>
<th>&quot;Fan Control Off&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zone 2</td>
<td>Alarm</td>
<td>&quot;Fan Control On&quot;</td>
</tr>
<tr>
<td>Both</td>
<td>Normal</td>
<td>&quot;Fan Control Auto&quot;</td>
</tr>
</tbody>
</table>

Configure both zones as non-Latch, Status, non-Anc1/Warning System/External Bell.

Fan Inputs

The exact requirement depends on the particular fan motor controller, and the contacts available (e.g. "Run", "Fault"). Commonly "Run" is provided by an air flow switch (AFS) and is required to connect to an AZC so that it can become part of a logic equation (as per circuits 3 & 4 of the KT0113 standard module 1945-19-3 and 1945-19-4).
CIRCUITS & ZONES  (CONTINUED)

Where a "Fault" contact is available, along with "Run", both can be put onto a single AZC with the NO "Fault" contact shorting the AZC and voltage band B1 programmed as "Fault" (refer to Fig 6.1.5 A). Alternatively, the NC "Fault" contact can be put in series for open circuit Fault, and the NO "Run" contact can short the AZC, with B1 programmed as "Alarm" (ZnD). (Refer to Fig 6.1.5 B). Note that in A, Fault overrides Run, and in B, Run overrides Fault. The priority in B can be reversed, but not in A.

The zone should be configured as non-latching.

If a "run" contact is used to short a Zener across the AZC (i.e. run is B2 = Alarm) and the normal state of the fan is "run", then the zone mapping to MAF should be configured as "Status Only" so that the fan "Run" state is not shown in the "Totals" or "Alarm Recalls".

![Diagram](image)

FIG 6.1.5
EXAMPLE OF FAN RUN & FAULT WIRING TO AZC

6.1.3 RELAYS

The exact number of relays per fan control and the logic required depends on the particular building and air conditioning plant.

Typically, one relay is required per fan to switch an interposing relay in the fan control equipment, with a possible logic equation as follows:

\[ R5 = Z15D + Z15N.Z5A \]

(i.e. the relay turns on to turn the fan off).

Where: Relay 5 is the Fan Control relay for a normally running fan
Zone 5 is the associated Air Duct Smoke circuit
Zone 15 is the associated Fan Control switch circuit with...

\[ Z15D \text{ (band B2) = "Fan Off" } \]
\[ Z15M \text{ (band B1) = "Fan On" } \]
\[ Z15N \text{ (bands B3, B4) = "Auto" } \]

Note that the zone range facility is useful in programming controls where selective, automatic switching is required. E.g. if zones 1-10 correspond to ducts in levels 1-10 of a building, and the logic requires Relay 5 to operate if Zone 5 is in alarm but zones 1-4 and 6-10 are not, the equation for R5 above would become:

\[ R5 = Z15D + Z15N.Z5A \cdot (Z1:4(1)A+Z6:10(1)A) \]

Note also, that if the interposing relay (fan control input) is 24V at less than 100mA then an open collector (O/C) may be used.
6.1.4 LEDS
The 3 LEDs may be controlled directly from the switch; driven off 3 open collector (O/C) outputs or driven off 2 O/Cs with a Zener diode as shown in Fig 6.1.6. Note that where the FIP has a number of detector circuits, the open collector outputs associated with these AZCs may be used for driving the AS1668 LEDs and so it doesn't matter if the AS1668 panel requires more open collectors than circuits.

A. THREE OPEN COLLECTOR O/PS PER FAN.

B. TWO OPEN COLLECTOR O/PS PER FAN.
For other LEDs (e.g. Chrome Bezel LEDs) a lower value (higher current) resistor may be required.

FIG 6.1.6
WIRING OF FAN CONTROL LEDS

Note that the logic required for the LEDs in Option B is as follows:

<table>
<thead>
<tr>
<th>LEDs</th>
<th>OUTPUTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUN</td>
<td>OC1</td>
</tr>
<tr>
<td>FAULT</td>
<td>OC2</td>
</tr>
<tr>
<td>STOPPED</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>LEDs</th>
<th>OUTPUTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUN off</td>
<td>OC1 off</td>
</tr>
<tr>
<td>FAULT off</td>
<td>OC2 on</td>
</tr>
<tr>
<td>STOPPED</td>
<td></td>
</tr>
</tbody>
</table>

Where x = off or on (don't care).
Each of these circuit arrangements can be achieved using the KT0113 kit – follow the assembly instructions supplied (LT0438). The board supplied in the kit must be modified as per the installation instructions to give circuit type 3 operation (2 outputs as per Figure 6.1.6B and shown on wiring diagram 1945-19-3) or type 4 operation (3 outputs as per Figure 6.1.6A and shown on wiring diagram 1945-19-4).

The KT0113 may be supplied in one of two formats - “A” and “B”. Format “A” has solder connections down both sides. Connections should be made to the RH side pads viewed from pcb rear. Ignore the LH side pads.

See Tables 1 and 2 for connections (functions).

6.1.5 AS1668 CONTROL MODULE & DRAWINGS

The following drawings are of 2 typical configurations using the KT0113 AS1688 Control Module.

Circuits 3 and 4 both use the KT0113 module, but involve selective "snipping" out of components as detailed on the instructions.

1945-19-3, AS1668 CONTROL MODULE, CIRCUIT 3
1945-19-4, AS1668 CONTROL MODULE, CIRCUIT 4

The original AS1668 kits were supplied with a different PCB for the switch/LEDs. This can be used in the following 4 circuits.

1945-1-1, AS1668 CONTROL MODULE, CIRCUIT 1
1945-1-2, AS1668 CONTROL MODULE, CIRCUIT 2
1945-1-3, AS1668 CONTROL MODULE, CIRCUIT 3
1945-1-4, AS1668 CONTROL MODULE, CIRCUIT 4
6.2 GASEOUS FIRE EXTINGUISHING

6.2.1 GENERAL

The following features of the F3200 make it well suited to gaseous fire extinguishing applications as required by AS4214:2002.

- AZC Alarm Text for "pressure switch", "manual", can be used for the various inputs;
- Zones can be programmed as latch/non-latch, MAF/non-MAF as required, e.g. non-latch, non-MAF, for "Gas Inhibit" input;
- Zone range operand allows easy programming of "voting systems" on detector circuits e.g. 2 out of 3;
- Open collector O/Ps can be programmed to drive LEDs such as "Gas Initiated", "Gas Inhibited", etc;
- Programmable timers included as standard (0-250 sec);
- Programmable relays, with supervision option;
- Operation not fixed by hardware, as virtually any required logic equation for outputs (using AND, OR, NOT, XOR) can be entered;
- Fuse protected battery-backed supplies available via 2A fuse and 6A fuse;
- Standard hinged, screened 7U Gas control doors available complete with LEDs, switches and looms for 1, 2, 3, 4 Gas Zones (Part Number ME0438 to ME0441 respectively);
- Standard non-hinged, screened 1U Panel as per above for 1 Gas Zone (Part Number ME0442);
- Standard Local Control Stations (LCSs) and AVI warning signs available. (LCS includes "Gas Start", "Gas Inhibit" switches, status LEDs). AVIs include selectable Alert and Evac tones and can be ordered with lettering such as FIRE ALARM / DO NOT ENTER, etc.

Two standard F3200 panels are available factory-fitted and programmed for gaseous fire extinguishing applications.

FP0876  FP F3200 AS4428 FIP 8U CAB 3A1U GAS CTRL PRE PROG
FP0877  FP F3200 AS4428 FIP STD CAB 6A 1U GAS CTL PRE PROG

FP0876 is an F3200 assembled into the 8U cabinet (FP0784). It comes complete with the ME0442 1 zone 1U gas control module and an 8 Relay Module. It has a 3A power supply.

FP0877 is based on a 6A (PSU) F3200 assembled in the standard 15U cabinet (FP0782). It comes complete with an ME0442 1 zone 1U gas control module pre-wired to the 8 Zone Module and an 8 Relay Module.

The gas control doors (ME0438-ME0442) are wired to provide 2-wire connections to the AVI Mk2s. Drawings 1931-123 and 1931-124 show how these are wired to F3200 and the external devices: AVI MK2, LCS, etc.

Special factory-assembled panels can be made to order to meet the specific requirements of jobs.

6.2.2 LOGIC & CONFIGURATION

A commonly used logic diagram for a dual circuit (single gas zone) gaseous fire extinguishing system is shown in Fig 6.2.1. This can be used with an F3200, ME0438-ME0442 gas control door, one or more Local Control Stations (FP0570), and multiple AVI Mk2. The configuration and programming of F3200 is as follows.
FIGURE 6.2.1
GAS RELEASE LOGIC DIAGRAM
LOGIC & CONFIGURATION (CONTINUED)

The logic equations for F3200 to match Fig 6.2.1 are as follows.

where:

OC1 = Gas Initiated LED (i.e. Timer Running)
OC2 = Manual Release Activated LED (i.e. LCS Gas Start)
OC3 = Gas Discharged LED
OC4 = System Inoperative (i.e. any isolate or fault in Gas Control System)
OC5 = Gas Inhibited LED

Zone 1 = Detector Cct 1
Zone 2 = Detector Cct 2
Zone 3 = Gas Start (LCS)
Zone 4 = Gas Released (Pressure Switch)
Zone 5 = Gas Inhibit (LCS)
Zone 6 = Gas Isolated (i.e. Gas Discharge Isolate switch operated, see note 3)
Zone 7 = Lock-off Valve (if required, see note 9)

Relay 1 = Alert or Evac O/P (1st stage sign FIRE ALARM)
Relay 2 = Evac O/P (2nd stage sign EVACUATE and DO NOT ENTER)
Relay 3 = Gas Release Solenoid
Relay 4 = System Inoperative sign
Isolate = Guard Relay (see note 2)

Timer
T1 [S30:0] = V1 30 Second time delay from "Gas Initiated" (second stage).

Variables
V1 = Z1A . Z2A . ^Z5A + Z3A

Open Collector LEDs
OC1 = V1
OC2 = Z3A
OC3 = Z4A
OC4 = Z5A + Z6A + OC5 + Z7A + Z3:7(1)I + Z1:7(1)F + R1F + R2F + R3F + R4F + R1I+ R2I
+ R3I + R4I + Guard I (see notes 2,9)
OC5 =Z1:2(1)I

Relays
R1 = Z1A + Z2A + Z3A + Z4A (Alert or Evac : Stage 1 or Stage 2)
R2 = Z4A + V1 (Evac Stage 2)
R3 = T1 (Gas Release)
R4 = OC4 (System Inoperative)
ISO (or Rn) = V1 (Guard) (see note 2)

Configure Circuits

6.2.3 NOTES

1. The variable V1 is used to initiate the timer rather than OC1 because outputs (including OC) can be tested from the keypad. It is not desirable to have a "test" function initiating the timer which releases gas.

2. The Guard relay is used to reduce the chances of accidental Gas Release (e.g. by someone performing a "Test" on the Gas Release Relay). (The test function may be inhibited, as may Isolate.) It uses a normally open set of contacts and is inserted between +VBF2 and the NO terminal of the Gas Release relay (R3). It is preferable to use an unused Brigade Relay (rated at 5A dc resistive) e.g. Isolate, if available (not Standby), else an ancillary relay, or a module relay (each rated at 2Adc resistive) on a separate 8RM to Gas Release. For multiple zones, a Module Relay "Guard" relay can be common for 2 Gas zones, or Brigade Relay "Guard" relay can be common to up to 5 Gas zones for 1A actuator loads. The common Guard relay should be programmed to operate off the OR of the variables. For example: IS0 = V1 + V2 + V3 for a 3 Risk FIP which used ISO as the Guard relay. If an Ancillary Module relay is used as the Guard relay, then +ARnI or +RnI should be added to the equation for OC4.

3. The Gas Discharge Isolate switch turns on the Gas Isolated LEDs on the gas control doors and LCSs directly, and causes a Gas Release relay supervision fault. The third set of contacts on the Gas Discharge Isolate switch is connected to AZC 6 (Gas Isolated) as shown on Drawings 1931-123, 124 so that "Gas Isolated" status can show on the LCD, be logged, and repeat from the FIP to an RZDU or remote FIP via a network. A suitable EOLR has to be soldered across the switch contacts (yellow and black remit wires) at time of building.

4. Snub (suppress) inductive loads (e.g. solenoids) with a suitably rated reverse diode.

5. The Gas Discharge Isolate switch disconnects both wires to the solenoid. When not isolated, however, the -ve wire is connected to 0V and only the positive supply is switched by the relay. This allows the relay supervision to check for resistance from the relay "common" contact to 0V.
NOTES (CONTINUED)

7. See Section 6.2.4 re use of actuators.

8. Solenoids are typically less than 400 Ohms and require a diode (of sufficient rating) to be wired in series at the solenoid to allow supervision. If two solenoids are connected in parallel on one circuit the supervision will not detect one being disconnected. Where multiple release circuits are diode connected (+ve & -ve legs) onto a common solenoid, the supervision will detect shorts, but not all opens.

9. If a Lock-off valve is not required, then Z7 is not required and can be left out of the equations (standard programming of FP0876 and FP0877). Note that AS4214 requires the Lock-off Valve to isolate both poles of the Gas Release solenoid / actuator. This is not done within the standard wiring and therefore needs to be done externally with microswitches (or a relay).

10. The standard LCS Gas Start switch automatically turns on when the glass is broken. Some customers may require a different switch that can be turned off after the glass is broken, and hence cancel the timer and prevent gas release.

11. Enable supervision on Relay 2 if using a 3-wire connection to the Alert/Evacuate warning signs.

6.2.4 USE OF ACTUATORS

Where a CV-98 actuator is used it must be connected in series with the 427354 current regulator, fitted at the furthest point to act as the EOL.

A single actuator should be connected in reverse, i.e. with the black wire to the incoming +ve voltage, so that the supervision can detect that the element has been fired. See Figure 6.2.2(a).

Multiple actuators may be connected in series on one circuit, but each must have the red wire to the incoming +ve voltage. See Figure 6.2.2(b). Note the F3200 supervision cannot detect the difference between an unfired element (<2 Ohm) and a fired one. The actuator has 3 series forward diodes across the element so that current will continue to flow through it after the element has fired. With F3200 if both actuators fire, a supervision fault may or may not be generated.

Where series resistors have been used (in existing circuits) to limit the current, a series diode must be fitted as the EOL. It must be a silicon diode (not Schottky) rated at 2Adc or higher, e.g. 1N5404. See Fig 6.2.2(c). The series resistor(s) must be located in the F3200 panel.

The maximum number of actuators connected in series in one circuit appears to be quoted by the manufacturer as 2. The following estimates for the Metron Protractor and 427354 current limiter (not confirmed by the manufacturer, consult the manufacturer) suggest that up to 4 actuators may be fitted to a circuit with a current regulator and up to 4 Ohms cable resistance.

Allow: 21V as worst case battery voltage; 6.5V drop for regulator; 2.5V drop per actuator; 1V per Ohm of cable resistance.

The Ansul HF Electric Actuator (PN 73327) can be used on the F3200. Two devices can be wired in series directly off the F3200 solenoid output, but if using just one device, a 21Ω resistor (Ansul PN 73606) must be wired in series with the Actuator. In both cases a suitable diode (e.g., 1N5404) must be wired in series (fit at the actuator) to provide short circuit detection. Refer Figure 6.2.2D.
a) Single device with regulator at furthest point

b) Multiple devices with current regulator at furthest point (EOL)

c) Multiple devices with limiting resistor (not recommended method).

6.2.5 AVI SIGNS

The AVI is an illuminated, 24Vdc warning sign with an internal sounder that produces AS2220 Alert and Evacuate warning tones or the ISO 8201 Evacuate signal (requires V1.20 or later software for ISO signal). It has two independent sets of indication (i.e. top and bottom), two signal inputs, and can be configured to provide the combinations of tone and illumination required for gas release warning signs. It can be ordered with one of a number of standard faceplates with wording such as FIRE ALARM / EVACUATE AREA.

Two models of AVI have been produced.
- The original AVI (FP0628) which uses incandescent lamps and produces only AS2220 tones;
- The AVI Mk2 (FP0853/4) which uses LEDs.

The wiring and set up for these AVIs are different.

6.2.5.1 AVI Mk2

Two standard versions of AVI Mk2 are available, with the faceplates (such as FIRE ALARM/DO NOT ENTER) ordered separately. FP0853 has two rows of red LEDs (i.e. to illuminate the top and bottom rows of lettering). FP0854 has 3 rows of yellow LEDs as required for the 3 line XXXX SYSTEM INOPERATIVE signs.

AVI Mk2s have 3 pairs of terminals that provide connection to the FIP, namely "COM", "IN-T" and "IN-B". Pairs are provided to allow "daisy chaining" of multiple AVIs off one FIP output circuit. A fourth pair "SYNC" allows for synchronisation of tone and LED flashing on daisy-chained AVIs.

IN-T operates the top LEDs, for which the default tone is Alert. IN-B operates the bottom LEDs for which the default tone is Evac. COM is the power supply common in a 3-wire arrangement and may be position or negative. Negative is generally used as that is required for the FIP relay supervision.

With a 2-wire connection from the FIP to the first AVI (3-wires to further AVIs if synchronised) when IN-T is positive and IN-B is negative the top LEDs flash, when IN-B is positive and IN-T is negative the bottom LEDs flash.

With a 3-wire connection from the FIP to the first AVI (4 wires to further AVIs if synchronised), a common negative is used and a positive voltage applied to IN-T/IN-B activates the top/ bottom LEDs. Note the bottom indication/tone overrides if both In-T and In-B are applied.

The wiring diagram 1931-124 for the gas control doors ME0438-442 shows a 2-wire connection, but can be used for a 3-wire connection (see below). Both facilitate supervision of the AVIs by the FIP relays for which a 2k7 resistor is a suitable EOL. Refer to Figures 6.2.3 and 6.2.4.

The logic equations in 6.2.2 for RL1 and RL2 work for both 2-wire and 3-wire because Evac overrides Alert and the default setting for IN-B turns on the top LEDs with the bottom.

However for 3-wire connections RL2 must be re-wired and configured as supervised (program supervision as enabled and fit Lk2 to S on the 8 Relay Bd).

Note the System Inoperative sign requires only one relay to switch 24V to IN-B, with IN-T (or COM) wired to 0V. Refer to Figure 6.2.5. Refer to the appropriate AVI instructions to disable the Evacuate tone.
AVI Mk2 (Continued)

The configuration of some commonly used signs is as follows.

*1 The AVI Mk2 has a third tone (RH3), which could be generated on Gas Discharged. Refer to the particular AVI instructions for setting the links as the function of the links depends on the software version fitted.

Options for XXXX include: CO2; INERGEN; FM-200.
Applications

For FIRE ALARM / DO NOT ENTER, FIRE ALARM / EVACUATE AREA
RL1 = Stage 1 OR Stage 2
RL2a = RL2b = Stage 2
LK1-LK6 not fitted.
S = Supervised
U = Unsupervised
EOL = 2k7
RL2a, RL2b can be two separate relays driven together.

For DO NOT ENTER / XXXX GAS DISCHARGED with the bottom lines having RH3 tone and operating off Gas Discharged.
RL1 = Stage 2 OR Gas Discharged.
RL2a = RL2b = Gas Discharged
LK3, LK6 fitted.
S = Supervised
U = Unsupervised
RL2a, RL2b can be two separate relays driven together.

FIGURE 6.2.3
AVI MK2 WIRING USING 2 WIRES

For FIRE ALARM / DO NOT ENTER, FIRE ALARM / EVACUATE AREA
RL1 = Stage 1
RL2 = Stage 2
LK1-LK6 not fitted.
S = Supervised
EOL = 2k7

For DO NOT ENTER / XXXX GAS DISCHARGED with the bottom lines having RH3 tone and operating off Gas Discharged
RL1 = Stage 2
LK3, LK6 fitted.
RL2 = Gas Discharged
S = Supervised

FIGURE 6.2.4
AVI MK2 WIRING USING 3 WIRES

For XXXX SYSTEM INOPERATIVE
RL1 = System Inoperative
LK5 and LK6 fitted (tone disabled).
Alternatively 0V could be connected to COM.
Only one unit is typically required, but more could be added as per the diagrams above.

FIGURE 6.2.5
AVI MK2 SYSTEM INOPERATIVE
6.2.5.2 Original AVI

Original AVIs (FP0628) have three pairs of terminals that accept signals from the FIP, namely '+24V', 'ALERT-', and 'EVAC-'. They can be connected and operated in two modes, namely 2-wire and 3-wire.

The typical connection for 3-wire mode has the +VBF supply connected to +24V, with switched 0V signals to ALERT- and EVAC- respectively, as was used on the original gas control doors (ME0005 – ME0069 see drawing 1931-47).

In 2-wire mode, the +24V terminals are not used. For an EVAC input, the +ve supply is connected to ALERT- (i.e. EVAC+) and the -ve supply (0V) is switched to EVAC-, and vice versa for Alert. Note the System Inoperative sign is configured for 3 wire special mode, but only two wires are required.

However these arrangements do not support supervision of the wiring to the AVIs. For supervised outputs the recommended method is to use only AVI MK2s and convert the ME0065 – ME0069 gas control door to a common 0V and switched 24V outputs – refer Section 6.2.6.

All signs should be configured for flashing illumination as that attracts attention and saves power. Note the original AVI has incandescent lamps that draw a large current.

The configuration of some commonly used signs is as follows.

Notes
a. The option of top lamps with Evac tone for one input, and both lamps with Evac tone for the other, is not directly supported. But it can be arranged by mounting the AVI upside down.
b. For this configuration the +ve supply is wired into Alert-, not +24V.
6.2.6 USING OLD ME0065 – ME0069 GAS CONTROL DOORS

Older F3200 gas panels were supplied with the ME0065-69 gas control doors (refer drawing 1931-47). These provide a common +24V supply and switched 0V outputs to activate the warning signs. They were designed for the original FP0628 AVI, but do support the Mk2 AVI. However, as wired these outputs are not suitable for supervising the wiring to the warning signs, as is now required.

These gas control doors can be modified to common 0V, switched 24V outputs to enable supervision of the warning signs. But in this case the original FP0628 AVIs cannot be used.

Two options exist for this – replace the gas control door with the equivalent 2-wire version (ME0438-ME0442), or modify it as shown in Drawing 1931-132 and in the steps as follows:

1. Turn power to the panel off and physically isolate the actuating device (operate the Gas Discharge Isolate switch). As a further precaution when working on gas extinguishing systems, disconnect the actuator or remove it from the gas release valve. Identify the thick black wire that runs from the Relay 1, 2 and 4 NO terminals to 0V on the MAF/PSU. Disconnect it from the MAF/PSU 0V terminal and connect to +VBF2 (or similar) instead. Place some red insulation tape around each end of the insulation to indicate it is now a positive wire, not negative.

2. Disconnect the two thick red wires that connect to the Sign+ screw terminal. Discard the one that runs to the +24V screw terminal, and reconnect the one that runs to the MAF/PSU to the +24V screw terminal.

3. Run a thick black wire from the Sign+ screw terminal to 0V on the MAF/PSU.

4. Re-label the following screw terminals:
   - Sign+ as Sign-
   - Alert- as Alert+
   - Evac- as Evac+
   - SIO- as SIO+

5. Run 3 wires to the Alert/Evac (Stage 1/Stage 2) sign(s) and 2 wires to the SIO sign. Connect Sign- to COM, Alert+ to IN-T, Evac+ to In-B on the Alert/Evac signs. Connect Sign- to com (or In-T) and SIO+ to In-B on System Inoperative Sign (set the links to disable tones). Fit a 2k7 ELD from each of Alert+, Evac+, and SIO+, to Sign- (0V) at the last AVI.

6. Configure Relays 1, 2, 3, and 4 for supervision (fit Lk 1-4 to the S position) on the 8 Relay Board.
USING OLD ME0065 – ME0069 GAS CONTROL DOORS (CONTINUED)

7. Enable supervision on Relay 2 (Evacuate Relay) and use the following logic in the programming.

   Relay 1 (Alert) : Supervision enabled, Latching, MAF mapped.
   Relay 2 (Evac) : Supervision enabled, Latching, MAF mapped.

   Relay 1 = Z1A + Z2A + Z3A + Z4A
   Relay 2 = Z4A + V1
   V1 = Z1A · Z2A · ^Z5A + Z3A

   Where:
   Z1 = Detection circuit 1
   Z2 = Detection circuit 2
   Z3 = Gas Start (LGCS)
   Z4 = Gas Released (Pressure Switch)
   Z5 = Gas Inhibited

   Program the panel as otherwise described in Section 6.2.2.

6.3 SUB FIP MONITORING

6.3.1 GENERAL
A sub-FIP is a Fire Indicator Panel (e.g. a Gas Flood Panel) which may not be connected directly to the Brigade, but repeats its common conditions (e.g. Fire, Fault) to another FIP. AS1670.1 allows for the cabling from FIP to sub-FIP to be less than 0.75sqmm, and the resistance may be considerably greater than that used in standard detector circuits. The "Low Current Mode" for an F3200 AZC allows supervision of sub-FIPs on circuits with high resistance.

The limitations caused by the resistance in sub-FIP monitoring circuits are shown in the following 3 cases.

1. **Loop Resistance Less than 150 Ohms**

For a detector circuit programmed for standard mode the maximum loop resistance is 50 Ohms, but where there is no detector load (i.e. clean contacts are used) the resistance may be up to 150 Ohms.

Therefore it is recommended that for loop circuits of less than 150 Ohms, "standard mode" be used for sub-FIP monitoring.

All voltage bands are potentially usable, but it is recommended that B3 NOT be used for any condition as the circuit voltage drop of up to 2.5V needs to be allowed for. B2 can be used with a 5V6 or 6V8 zener diode to detect Alarm i.e. ZnA, and B1 can be used to detect Alarm (ZnD) or Instant Alarm (ZnM).

2. **Loop Resistance of 150 Ohm to 800 Ohm**

For this resistance range the AZC has to be programmed into "Low Current Mode", and voltage band B1 should be programmed as Fault or Alarm but must not be used to detect the Fault signal from the sub-FIP (i.e. by shorting the circuit with the Fault contacts). Shorting the circuit at the sub-FIP will cause B2 Alarm.

Because the voltage drop in the circuit wiring is between 3.8V and 12V, depending on loop resistance, it is recommended that B3 not be used to detect a signal (for safety sake it is advisable to program B3 as Alarm and B1 as Alarm or Fault. Note that only a short somewhere within the circuit wiring can cause B1).

3. **Loop Resistance of 800 Ohm to 2000 Ohm**

For this resistance range the AZC has to be programmed into "low current mode", and the voltage band B3 has to be programmed as Alarm. Shorting the circuit at the sub-FIP will cause either a B2 or B3 Alarm depending on the loop resistance (nominal B2/B3 threshold is 1100 Ohm).

B1 may be programmed as Fault or Alarm, but must not be used to detect the Fault signal from the sub-FIP.

6.3.2 CONNECTION
There are various connection possibilities depending on the particular local requirements for Standby and Isolate, and the loop resistance. One or two AZCs may be required.

Where Standby is required as a separate signal at the Main FIP it can be signalled as Alarm on a second AZC and the corresponding zone programmed as non-MAF, non-Anc1, etc. Isolate could be signalled as "Fault" on the same AZC (ref Fig 6.3.1 and Fig 6.3.2).
CONNECTION (CONTINUED)

The Main FIP Brigade Standby and Isolate relays could be reprogrammed to include the "standby" zone "alarm" and "fault" conditions, or separate module relays could be programmed to operate on the zone "alarm" and "fault" conditions. These would then be connected to the Brigade transmitting device in series/parallel with the Standby and Isolate contacts of the MAF Brigade relays as appropriate.

Note that the EOL required depends on the mode programmed for the AZC.

Fault, Isolate and Standby are all represented by ZnF in the Main FIP.

Program B1 as Instant, ZnM represents "Alarm" ZnD represents "Standby" ZnF represents "Fault" or "Isolate"
6.4 FIRE DETECTION IN HAZARDOUS AREAS (EXPLOSIVE ATMOSPHERES)

6.4.1 REFERENCES
AS 2380  Electrical Equipment for Explosive Atmospheres - Explosion-Protection Techniques.
AS 2430  Classification of Hazardous Areas.
IEC79    Electrical Apparatus for Explosive Atmospheres.
SAA HB13 Electrical Equipment for Hazardous Areas (handbook).

6.4.2 GENERAL
A hazardous area is one which has a potentially explosive atmosphere due to combustible gases, liquids or dusts. In such an area there has to be a constraint to prevent an electrical fault from causing an explosion.

For fire detection in hazardous areas there are two main options:

1) Use approved IS (Intrinsically Safe) detectors and bases with IS isolators or Zener barriers and approved cabling.

2) Use approved detectors with explosion proof housings and compatible cabling. These are not discussed further in this section as the constraints are primarily mechanical.

Note that in addition to equipment selection and inter-connection, there are other requirements for wiring in hazardous areas that must be satisfied.

These include (but are not limited to):

- Matching “Ex” rating of equipment chosen with hazardous area classification.
- Ensuring cable capacitance and inductance is within the limits of the repeaters used (see Tables 6.4.3, 6.4.4, 6.4.5 for more details).
- Providing adequate physical protection for equipment according to local hazardous area wiring regulations.
- Using cable of the correct insulation and physical strength according to local hazardous area wiring regulations.
- Complying with manufacturer’s instructions for mounting of “Ex” rated devices.
- Inspection and certification of the finished installation.
6.4.3 INTRINSICALLY SAFE DETECTION

There are two types of device which may be inserted in a detector circuit between the FIP and the detectors to limit the electrical energy flow into the hazardous area and provide IS detection:

1) Galvanically (transformer) isolated repeaters (isolators).

2) Zener barriers (shunt barriers with fuses). These limit the circuit voltage relative to earth, and the circuit current.

Although Zener barriers are cheaper than isolators they require a special Intrinsic Safety Earth, and other precautions, and are therefore not recommended.

6.4.3.1 ISOLATED REPEATERS

There are several options for using isolated repeaters, each with differing limitations and expense.

The options are:

1. Use a 6 terminal isolating repeater where large numbers of smoke and/or flame detectors are required (see Section 6.4.3.2).

2. Use a lower-cost 4 terminal isolating repeater and a ZAU401 (Rev 2) where lower numbers of smoke and/or flame detectors are required (see Section 6.4.3.3).

3. Use a 4 terminal isolating repeater where all detectors generate a short circuit alarm condition (see Section 6.4.3.4).

For these the total capacitance and inductance of the detectors and cables on the IS circuit must be less than that specified in Table 6.4.1. The gases and vapours in each Gas group are listed in IEC 79-12.

TABLE 6.4.1
MAXIMUM CAPACITANCE & INDUCTANCE PER IS CIRCUIT

For isolated repeaters, the cable core to core capacitance can be used, rather than core to earth which, for bunched conductors on metal trays, may be higher. (Note that for Zener barriers, the core to earth capacitance is relevant). The values used in this section for a typical TPS pair, or multicore cable (unshielded) are:

TPS: $C = 100\text{nF/km}$ (i.e. $100 \text{ pF/m}$), $L = 0.8\text{mH/km}$

Cable manufacturers may quote differing values for specific cables.

It is the responsibility of the System Engineer to check that the cable used has values less than or equal to the above values, and that the total capacitance and inductance for each circuit meet the requirements.

The values specified for the detectors are shown in Table 6.4.2.

### Notes

1. The KHD0-ICS/Ex 251 or KFD0-CS-Ex 2.51P is effectively two KHD0-ICS/Ex 151 or KFD0 CS-Ex 1.51P isolators (respectively) in one package.

2. The resistance quoted in Table 6.4.2 for fire wire is per wire, thus the circuit resistance of the pair is twice that amount.

3. Most of these detectors are not CSIRO listed.

For each of the following configuration options a table is included showing the limits of detector quantity and cable length.

### 6.4.3.2 6 TERMINAL ISOLATED REPEATER

The following 6 terminal isolating repeaters can connect an F3200 zone to an IS detection circuit using the circuit of Fig 6.4.3.2. Detector quantities and circuit lengths are shown in Table 6.4.3. The pin numbers shown are for the KFD2-SC4-Ex1.

Pepperl & Fuchs KFD2-SC4-Ex1  
Pepperl & Fuchs KHD3-ICR/Ex130 200 (Obsolete)  
Pepperl & Fuchs KFD2-CR-Ex1.30 200 (Obsolete)
For each AZC there must be either: a corresponding relay (e.g. Module Relay RLn) with normally closed contacts breaking the supply to the Isolator as shown; or an open collector output switching the supply 0V to the Isolator as shown. As the open collector is standard with an 8ZM it is the cheapest alternative.

**Programming & Limitations**

All detector types require the circuit to be programmed for Mode 1 (Std) with voltage band B1 programmed as Alarm.

The open collector must be programmed as OCn = ^ZnR, or the Relay must be programmed as Rn = ZnR (i.e. Zone n not in Reset or Zone n in Reset respectively).

There is no differentiation of voltage bands (B1, B2, B3), i.e., the FIP cannot differentiate between a short circuit fault, a shorting device such as an MCP, and detector operation on the same circuit.
6 TERMINAL ISOLATED REPEATER (CONTINUED)

Any alarm on the detector circuit (either a short circuit or detector operation) will cause a B1 or a B2 voltage level on the FIP AZC, depending on the battery voltage.

TABLE 6.4.3
MAXIMUM DETECTOR QUANTITY & CABLE LENGTH FOR 6-TERMINAL REPEATER

Notes

1. Circuit lengths quoted are from the isolator to the EOL. An extra 50 Ohms of cable from the FIP to the isolator is also allowed (1.5km of 1.0mm², 1.1km of 0.75mm²). The length quoted is the maximum for the corresponding quantity of detectors.

2. Cable resistance shown is for the circuit, i.e. both cables in the pair. The value of 34Ω per km (return) is used for 1 mm².

Issue 1.22 5 July 2016
6 TERMINAL ISOLATED REPEATER (CONTINUED)

3. The maximum resistances shown for the fire wire circuits must include both cable and fire wire (see Table 6.4.2 and associated note 2).

4. The letter in ( ) after the cable length, and the value in ( ) under the cable length specify which parameter out of capacitance (C), inductance (L) and resistance (R) provides the limitation, and what the maximum value is.

5. The (M) after a detector quantity indicates the maximum quantity allowed per circuit.

6. The maximum allowable detector quiescent (or 2 second switch on) current is 3.5mA (only relevant to R24BEx).

6.4.3.3 4 TERMINAL ISOLATED REPEATER WITH ZONE ADAPTOR UNIT ZAU401

With the addition of the ZAU401 Zone Adaptor Unit Rev 2 (PA0838), a lower-cost 4-terminal isolating repeater can be used with the F3200 panel.

The ZAU401 can be thought of as a single zone circuit module that can be added to a panel to make it compatible with a wider range of detectors – in particular when using IS repeaters. It can support up to 2mA of quiescent detector current and normally uses a 3k9 5% EOL resistor.

Wiring of the ZAU401 and the isolating repeater to the panel is shown in Fig 6.4.3.3. Note that only one ZAU401 can be connected to each of the panel’s zone circuits.

The following 4-terminal isolating repeaters can be used to connect the ZAU401 to an IS detection circuit. Note that dual channel repeaters have two separate repeaters, and can connect two circuits with two ZAU401s. Detector quantity and circuit lengths are 6 shown in Table 6.4.4.

Pepperl & Fuchs KHD0-ICS/Ex 1.51 (single channel)
Pepperl & Fuchs KHD0-ICS/Ex 2.51 (dual channel)
Pepperl & Fuchs KFD0-CS-Ex 1.51P (single channel)
Pepperl & Fuchs KFD0-CS-Ex 2.51P (dual channel)

![FIG 6.4.3.3 F3200 WITH ZAU401 & 4 TERMINAL IS REPEATER]
**4 TERMINAL ISOLATED REPEATER WITH ZONE ADAPTOR UNIT ZAU401 (REV 2) (CONTINUED)**

### Programming & Limitations

The circuit should be programmed as Mode 1 (standard). Voltage bands B1 and B3 can be left at default, though it is better to program B1 as fault.

Note that all alarms from the ZAU401 will give voltage band B2 i.e. the FIP cannot differentiate between short-circuiting MCP and detector operation, and voltage B1 represents a short on the circuit between the FIP and the ZAU401 (i.e. internal wiring fault).

**Table 6.4.4**

MAXIMUM DETECTOR QUANTITY & CABLE LENGTH FOR ZAU401 (REV 2) & 4-TERMINAL REPEATER
4 TERMINAL ISOLATED REPEATER WITH ZONE ADAPTOR UNIT ZAU401 (REV 2) (CONTINUED)

Notes

1. Circuit lengths quoted are total from the FIP to the EOL. The length quoted is the maximum for the corresponding quantity of detectors.

2. Cable resistance shown is for the circuit, i.e. both cables in the pair. The value of 34Ω per km (return) is used for 1 mm².

3. The maximum resistances shown for the fire wire circuits must include both cable and fire wire (see Table 6.4.2 and associated note 2).

4. The letter in ( ) after the cable length, and the value in ( ) under the cable length specify which parameter out of capacitance (C), inductance (L) and resistance (R) provides the limitation, and what the maximum value is.

5. The (M) after a detector quantity indicates the maximum quantity allowed per circuit.

6. The maximum detector quantity permitted is calculated using a maximum circuit current of 1.8mA for C29BEx and 0.3mA for R24BEx.

6.4.3.4 4 TERMINAL ISOLATED REPEATER ALONE

When all the detectors on the IS circuit will generate a short circuit alarm condition it is possible to use the lower-cost, 4-terminal isolating repeater without a ZAU401. This is shown in Fig 6.4.3.4.

The following 4-terminal isolating repeaters can be used. Note that dual channel repeaters have two separate repeaters and can connect two circuits to the panel.

- Pepperl & Fuchs KHD0-ICS/Ex 1.51 (single channel)
- Pepperl & Fuchs KHD0-ICS/Ex 2.51 (dual channel)
- Pepperl & Fuchs KFD0-CS-Ex 1.51P (single channel)
- Pepperl & Fuchs KFD0-CS-Ex 2.51P (dual channel)
- Measurement Technology Ltd MTL5061 (dual channel)

![Diagram of short-circuiting detectors with 4 terminal repeater]

FIG 6.4.3.4 SHORT-CIRCUITING DETECTORS WITH 4 TERMINAL REPEATER
4 TERMINAL ISOLATED REPEATER ALONE (CONTINUED)

Programming & Limitations

The required EOL resistance is lower than the standard 2k7. Two methods for obtaining the correct EOL value are:

1. Place a 22K 5% resistor in parallel with the supplied 2k7 EOL. This achieves the required value.

2. Or just use a 2k2 5% resistor as the EOL.

The circuit should be programmed as Mode 1, B3 as Normal, and B1 should be programmed as Fault.

There can be no differentiation between a short circuit fault, a short-circuiting MCP, and detector operation on the same circuit.

Detector quantity and circuit length limits are shown in Table 6.4.5.

TABLE 6.4.5
MAXIMUM DETECTOR QUANTITY & CABLE LENGTH FOR 4 TERMINAL REPEATER ALONE

Notes

1. Circuit lengths quoted are from the isolator to the EOL. The length quoted is the maximum for the corresponding quantity of detectors.

2. Cable resistance shown is for the circuit, i.e. both cables in the pair. The value of 34Ω per km (return) is used for 1 mm².

3. The maximum resistances shown for the fire wire circuits must include both cable and fire wire (see table 6.4.2 and associated note 2).

4. The letter in ( ) after the cable length, and the value in ( ) under the cable length specify which parameter out of capacitance (C), inductance (L) and resistance (R) provides the limitation, and what the limiting value is.

5. The (M) after a detector quantity indicates the maximum quantity allowed per circuit.
6.5 USE OF NORMALLY CLOSED CONTACTS

There may be some situations where it is necessary to monitor a set of normally-closed contacts which open on "alarm".

As standard these cannot be wired directly to the F3200 AZC terminals.

The Vigilant Contact Conversion Module (part number PA0443) may be used as a conversion interface between the contacts and an F3200 AZC.

This small, encapsulated module has three wires protruding from it.

These must be connected between the normally closed contact and the AZC as shown in Fig 6.5.1, using suitable screw terminal blocks.

The module applies a low impedance to the AZC when the alarm contacts open, and so the circuit must be programmed as B1 = Alarm.

![Diagram of Normally Closed Contact Wiring to F3200 AZC](image-url)
6.6 SPECIAL CONNECTIONS TO DETECTORS

6.6.1 CONNECTING THE S231I+ OR S231F+ (NON-HAZARDOUS AREA APPLICATIONS)

** WARNING **
Even though the S231i+ is listed as hazardous area rated, this section is for a direct connection – not through an intrinsically-safe isolator, and thus cannot be used in hazardous area applications. For IS applications refer to Section 6.4.

The S231i+ and S231f+ detectors are not directly compatible with the F3200. However, compatibility can be achieved by using the PA0838 ZAU401 (Rev 2) Zone Adaptor unit between the panel and the detectors.

The ZAU401 can be thought of as a single zone circuit module that can be added to a panel to make it compatible with a wider range of detectors. The ZAU401 supports up to 2mA of quiescent detector current, thus only 5 S231i+ or S231f+ detectors can be used on each ZAU401. It operates off the panel’s 24V supply and consumes 20mA in the normal state.

Only one ZAU401 can be connected to each circuit on the panel. Also, do not use a Rev 1 or non-Vigilant manufactured ZAU401 as these have different characteristics.

A 220E 5W resistor (Vigilant part number RR0415) must be placed in series with the detector circuit at the ZAU401 to limit the maximum current to any detectors in alarm.

Wiring of the ZAU401 to the panel and S231i+ or S231f+ detectors is shown in Fig 6.6.1.1.

* EOL to suit Panel used.
CHAPTER 7
ALIGNMENT, ADJUSTMENT & PLACING INTO OPERATION
## 7.1 ALIGNMENT & ADJUSTMENT

All the F3200 modules (pcbs) are tested and aligned in the factory before being supplied to the customer or fitted to a FIP. The only field adjustments that may be necessary are to set the LCD contrast and the battery charger voltage.

### Controller/Display

- **VR2** LCD Contrast
  - Adjust for best readability of the LCD when viewed from the front of an installed panel.

### Factory adjustments include:

<table>
<thead>
<tr>
<th>Component</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VR1</td>
<td>Set 1.2V Ref</td>
<td>Adjust for Charger High voltage of 28.1V to 28.15V.</td>
</tr>
<tr>
<td>VR3</td>
<td>Adjust 15.9V</td>
<td>Adjust until the 15.9V reference on TP15 is 15.90Vdc.</td>
</tr>
<tr>
<td>R94, R105</td>
<td>Fault Threshold</td>
<td>Snip as required to set Fault Threshold to nominal 19.03V.</td>
</tr>
</tbody>
</table>

### MAF/PSU

- **PT1** Battery Charger Voltage

Should the battery charger voltage need adjusting, the method is as follows:

1. Run the system with the door closed for at least 30 minutes to allow components to "warm up" (the longer the better).
2. Calculate the required no-load battery charging voltage by taking 27.3V for 20°C and subtracting approximately 0.1V for every 3°C above 20°C, or adding approximately 0.1V for every 3°C below 20°C.
3. With the system not in Alarm, disconnect the batteries.
4. Measure the voltage at the battery terminals and adjust to the voltage calculated in Step 2 by turning PT1.
5. Re-connect the batteries.

**PT2** +22V Supply is factory set and should not need field adjustment.
7.2 PLACING INTO OPERATION

7.2.1 GENERAL

This chapter describes the procedure to place an F3200 FIP into operation. It assumes that the mains and other field wiring has been connected, but that the battery has not and the mains is not yet switched on. Note that all electronic modules were tested and adjusted in the factory and should need no further adjustment.

Before switching on power (mains), inspect the cabinet and internals. Check as follows:

1. Check that all equipment is securely mounted, and that all cables are connected at the appropriate points. The factory checklist is included.

2. Check that the 8 way modules and (if required) the 16 Zone LED Displays are fitted and connected correctly. (See Sections 2.3.2, 4.2 and 5.11).

3. Check that any additional overcurrent protection device is fitted as per Chapter 4. Note that batteries are not yet connected.

4. Check that links Lk2-4 on the MAF are fitted (unless Anc3, clean contacts is being used), and module relay supervision links are fitted in the S position for relays which require supervision.

5. Check that the field wiring of AZC and relays is as per the "As Built" wiring diagrams and corresponds to the configuration of modules and links.

The "MAINS ISOLATE SWITCH" is located at the top right hand side of the cabinet rear, to the left of the mains transformer, behind the inner display door. This controls the mains power to the FIP, charger and power supply, and should be left on once the FIP is operational.

NOTE: The Battery is not disconnected by the "MAINS ISOLATE SWITCH".
**POWER UP**

To place the F3200 FIP into operation, perform the following steps:

**STEP 1** Ensure that the Mains Isolate Switch is OFF.

**STEP 2** Ensure that 240 VAC is connected to the panel from the mains distribution switchboard.

**STEP 3** Ensure that LK7 on the controller is set to the DATABASE WRITE PROTECT position before powering on the panel. If an E2INIT is required before programming, fit Minijump SW1. (Refer to the Programming Manual).

Turn the Mains Isolate Switch ON.

**STEP 4** Check that the buzzer sounds and all LEDs on the Operator Display panel flash for 2 seconds (except Mains On).

**STEP 5** Check that the green "MAINS ON" LED indicator is on. The Controller performs tests on its memory, electronics, and the LCD.

**STEP 6** Check that the LCD has good visibility. The LCD displays the FIP PCB configuration before showing the Base Display.

**STEP 7** If doing an E2INIT, set LK7 to the DATABASE WRITE position, remove minijump SW1 and press "ACK" to complete the sequence.

**STEP 8** Install and connect the batteries. Take care not to short the battery leads or connect in reverse polarity when connecting.

**STEP 9** If required, complete programming as per the Programming Manual and then fit Lk7 on the Controller to the DATABASE PROTECT position.

**STEP 10** Perform a Battery Test. If this fails check the battery connections, leave for 24 hours and then retest.

**STEP 11** Perform a System Test (de-isolate all zones first), and a test of the External Bell and Warning System (if fitted).

A full commissioning test should be carried out as per AS1670.1.
7.2.3 COMMISSIONING CHECKLIST
The following checklist should have been completed and supplied by the manufacturer. It should be placed with other System Configuration Information. Commissioning staff should check the installed FIP against it. (Note that all pcbs are electronically tested and adjusted before being fitted to the FIP).

1. CABINET & GENERAL
   A) Cabinet colour - Standard Cream Wrinkle (BFF 998 CW) - Other: ________________________________
   B) Cabinet undamaged (Paint OK)                           ☐
   C) Door aligned correctly                                 ☐
   D) Window undamaged and fitted correctly                  ☐
   E) MCP fitted and undamaged                               ☐
   F) Cabinet Door locks firmly, operates microswitch        ☐
   G) Lock - 003 Type & two keys supplied                    ☐
   H) Door seals fitted to top and sides                     ☐
   I) Display Keypad and 4U door fitted & aligned correctly  ☐
   J) If cardframe fitted, card fits frame correctly         ☐
   K) Standoffs fitted to cabinet rear (none missing)        ☐
   L) Operator Manual and battery leads included            ☐
   M) Manufacturer’s label completed, fitted                ☐

2. PCBS & WIRING
   A) MAF/PSU Fitted securely on standoffs                   ☐
   B) Controller/Display fitted securely                     ☐
   C) 8ZM fitted securely, earth screw fitted               ☐
   D) FRC Looms fitted correctly                             ☐
   E) MCP & door switch wires fitted to J6 of MAF/PSU, secured ☐
   F) Earth wire fitted to display door                      ☐
   G) All 3 modules earth to cabinet metal                   ☐
COMMISSIONING CHECKLIST   (CONTINUED)

3.  POWER SUPPLY
   A)  Mains Wired correctly, MOV, cap fitted
   B)  "Mains Isolate Switch" and "NAE" label fitted
   C)  Mains Earth wired to stud, good contact
   D)  Mains Switch neon off/on for switch off/on
   E)  MAF/PSU Mains On LED on, Fuse Blown LED off
   F)  VRECT at DC IN tab 40-42Vdc
   G)  Charger Voltage 27.25-27.4V warm, 27.5-27.75V cold

4.  OPERATION
   A)  LEDs flash, aligned with windows, "MAINS ON" LED on
   B)  Buzzer pulses with microswitch operated, Lk7 in Write
   C)  Controller LK7 in "Protect" position
   D)  LCD contrast correct for front view
   E)  De-isolate zones, system test pass on all (8) circuits
   F)  FIP MCP Programmed to Zone 1; Other: ___________ OK
   G)  "ALM" LED flashes & buzzer pulses for MCP operation
   H)  Acknowledge silences buzzer, Zone Resets
   I)  Controller Lk2 fitted (not in Service mode)

SERIAL NUMBER __________________________ TEST PASSED ☐

DATE : …………….. SIGNATURE : …………………………………
7.3 ERROR MESSAGES FOR STARTUP

Listed below are some error messages that can appear on the LCD during installation. Refer also to Section 6.16 System Faults in the Operator Manual LT0250.

Error messages that can occur on start-up or exit from program mode

"Shift reg clocking fault"
"Invalid # shift regs. Total # regs=xxx  # input regs=xxx"
These messages indicate a hardware fault with the shift register bus that connects the Controller, MAF/PSU, 8 Zone, and 8 Relay modules. The fault could be on the Controller, the interconnecting FRCs or any of the connected boards. Try connecting just the MAF/PSU on its own and with different cables to isolate the problem.

"Shift reg driver fault"
This message indicates a problem with the software driver for the shift register bus.

"Clock crystal timebase check fail"
This message indicates a hardware fault on the Controller.

"Clock chip ram write read fail"
"Clock register write read fail"
"Clock startup fault"
These messages indicate a hardware fault on the Controller.

"Eprom CRC fail"
This message indicates the checksum of the software program code is incorrect. This can be caused by a damaged EPROM or some other hardware fault on the Controller.

Error messages that can occur on entry to program mode

"This database is invalid and should be reinitialised-net dbase in non net panel"
This message is produced on entry to program mode when a database created with networked F3200 or NDU software is used with non-networked software. This is unusable and the database should be re-initialised and reprogrammed.
APPENDIX A1
COMPATIBLE ACTUATING DEVICES (DETECTORS)

The following detectors are compatible with the F3200 System. The maximum number of detectors per circuit is indicated by the columns 4mA and IS, for Standard and Intrinsically Safe applications. For IS application refer to Section 6.4.

**Table VI**

Tyco Detector/Base & Remote LED Range

The E500 remote indicators are designed to operate across typically 5V.

**E500**  
R = 180Ω, Vf LED = 2.2V typical

**E500 Mk2**  
R = 1.2kΩ, Vf LED = 1.75V typical
ACTUATING DEVICE COMPATIBILITY

NOTES

1) The maximum number of detectors per AZC allowed by the standard is 40.

2) Those detectors shown in brackets are old models and have the same characteristics as the current models.

3) Detectors indicated by a "x" may be used in INTRINSICALLY SAFE AREAS in conjunction with approved and compatible, intrinsically safe adaptors. The number allowed in a particular circuit may be less than the maximum shown. See Section 6.4.
   
   V41/42/44B detectors have flameproof enclosures.

4) Detectors indicated by a "+", which are used in HOSTILE CLIMATIC ENVIRONMENTS, may be directly connected to the panel, if they are not required to be intrinsically safe.

5) Detectors indicated by a "***", are not current models and should not be used for new installations.

6) Detectors indicated by an "&", normally use an incandescent lamp which will have a low intensity when used in mode 1.
   The lamp can be replaced with an LED kit.

7) The B111B beam and V41B/V42B/V44B flame detectors require power from the fused +24 VDC supply.

8) Hard Contact devices are indicated by a "#". Where an AZC has only hard contact detectors the circuit resistance may be up to 150 Ohms maximum to guarantee voltage band B1 operation.

9) There is a 12V version of Flameguard which may be used by adding a Zener diode. The Intertec detectors require a series diode to be fitted for compatibility. Both of these are detailed in Product Bulletin PBF0080.

10) The Olsen FW81B code for fire wire has been replaced by FW followed by the temperature rating in °C, e.g. FW68, FW105. Only FW68 is currently approved and listed.

11) Detectors indicated by a "^" have not been SSL/CSIRO accessed for compatibility.

12) Detectors indicated by a "@" cannot have their remote indicator outputs wired in common with Tyco 614 series or the Minerva M614 series (and most other Tyco/Olsen detectors).
APPENDIX A2
PROGRAMMING FOR DETECTOR TYPE

1. GENERAL

The default programming (i.e. by E2-INIT) for AZCs (circuits) and zones is:

Circuits

<table>
<thead>
<tr>
<th>Alarm Text</th>
<th>Mode</th>
<th>Delay (Type)</th>
<th>Voltage Band B1 (0-3V)</th>
<th>Voltage Band B3 (13-17.5V)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Smoke</td>
<td>1 Standard</td>
<td>1 Standard</td>
<td>1 Instant Alarm</td>
<td>1 Instant Alarm</td>
</tr>
</tbody>
</table>

Zones

<table>
<thead>
<tr>
<th>Latch/Non-Latch</th>
<th>Mapped/Not to MAF</th>
<th>Mapped/Not to Anc 1</th>
<th>Mapped/Not To Warning System</th>
<th>Mapped/Not To Ext Bell</th>
<th>LED Map (Zone n)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latch</td>
<td>Mapped</td>
<td>Mapped</td>
<td>Mapped</td>
<td>Mapped</td>
<td>LED n</td>
</tr>
</tbody>
</table>

The default "circuit" programming suits most of the common "electronic" (as opposed to "hard contact") smoke detectors and hard contact detectors in electronic bases, where these are not used with external (remote) LED indicators.

Where other types of detector are used, or detectors are used to switch remote LED indicators directly so that the alarm voltage is out of the B2 range (approx. 3V-13V), the circuit will have to be programmed accordingly. In some cases constraints are also applied to zone programming. For example, where a non-latching detector (e.g. Olsen P76B) is used for air duct sampling, then as well as programming the circuit for the appropriate RAD or SAD time delay sequence, the zone should be programmed as non-latching.

2. ALARM TEXT

Choose the appropriate text for each detector type e.g. smoke (default) for smoke detectors, heat for thermal detectors, etc. There is provision for creating new names if the standard ones are not sufficient.

The Instant Alarm text may also be changed if required (default is manual).

3. MODE

Mode 1 (standard) suits most detectors where remote LEDs are not used.

High Current Detectors

The following detectors require the F3200 circuit to be programmed into high current mode (mode 2) to give sufficient LED (lamp) illumination current.

Olsen C23B, C23BEx, R23B, R24B (and Ex where applicable), Flameguard, Intertec, Apollo Series 60.
APPENDIX A2 (CONTINUED)

Remote LEDs

Where remote LEDs are used, mode 2 may have to be selected to give sufficient current for illumination, depending on the particular LED kit used.

Where mode 2 is selected, some detectors require voltage band B3 to be programmed as Alarm. See tables I-V.

4. DELAY TYPE

Delay types 2 and 3 with a delay out of alarm (Delay 2 greater than 0) require a non-latching detector (e.g. Olsen P76B).

5. VOLTAGE BANDS

The following tables I-V show the expected alarm voltage band for each type of detector in Mode 1 (standard) and Mode 2 (high current). A "-" means there is no need to use Mode 2 (and it should not be used).

Where a value other than B2 is shown (e.g. B1 or B3), then that voltage band must be programmed as Alarm, as well as B2.

Hard Contact Detectors

Hard contact detectors that are not fitted to an electronic base may also be connected directly across the circuit. Program the detector type as appropriate (e.g. heat, flowswitch) and voltage band B1 as Alarm (detector operated).

If detectors and MCPs are to be used on the same circuit, with differentiation between them (e.g. for AVF), then it is necessary to use 15V MCPs and program B3 = Instant Alarm. This means that 15V MCPs cannot be used on the same circuit as any detector that requires B3 = Alarm.

**Table IV**

Tyco Detector Range
### Table V

#### Other Detectors

#### Notes

1. Hard contact devices without "electronic" bases give voltage band B1 unless a 6V8 zener diode is wired in series with the contacts which gives B2 alarm.

2. The P76B requires band B3 to be programmed as Alarm (detector operated) though typical operation for both modes 1 and 2 will give B2 voltage (just less than 12V).

   For non-latching operation the zone must be programmed as non-latching.

3. The C23B and C23BEx (old types of detectors) may have a nominal 6V/30mA bulb in them which require Mode 2 for illumination. The bulbs may have been replaced with LEDs. Although the bulb would typically give B2 operation, it is safest to program B3 as Alarm. The R23B with an LED needs only B2 in Mode 2. (Note that the incandescent lamps do not meet the SSL005 Standard).

4. Detectors shown with an "***" need to be programmed for Mode 2 to give sufficient lamp illumination. The Flameguard detectors require Mode 2 for latching and require an extra resistor (270E, 5W) to be switched in from +VBF to the AZC+ terminal for LED illumination. If relay n is used to boost AZCm, the logic for the relay is $R_n = ZmA.\cdot ZmR$.

5. For IS applications refer to Section 6.4.

### WARNING

Detectors which require voltage band B3 to be programmed as Alarm (detector operated) cannot have an MCP with a 15V Zener Diode (e.g. SU0600) connected to the same circuit.
